Perhaps the demo version of HDDriver will suit your needs, alternatives are Steffen Engle's CBHD (English docs etc on my web site) or Atari's AHDI.

NOVA vdi allows you to have more then one page of screen in the board's video
memory. You can switch between them by using the normal Setscreen XBIOS function.
You can get the addresses and the number of pages from the 'IMNE' cookie.

If you run Magic, you should drop METAXBS.PRX in your auto folder and
disable METADOS.PRG (ie. rename it *.prx too), and put SPINMAGC.XFS in
the XTENSION folder.

If you "only" run single Tos, sorry I don't know.

Bye,
/Pascal/

i got some e-mail from a guy along with some kind of a text file
telling me how i could protect my computer from crashing because of
the y2k bug.

i replyed that i didn't need to worry about it on my Atari TT030,

here is his answer:

Return-Path: <computechone@uswest.net>

Well, living in the dark ages can't be all that bad.
Like to see how well Falcon 4 & Quake3 run on that Atari.

i told him that i don't play games on my TT, that i use my Jaguar
for that. he's never answered me. must be mad because he couldn't
sell me something.

I was thinking of the same thing myself. :)

It would be a big help to all Atari folks if you could make this info
available on the web as a text file. Especially those who won't be able
to get the last issue.

I hate to see AC go BTW, and wish all that made the mag possible the
best of luck.

Hi Ritchie,

I'd recommend what the folks in the other replys have suggested and
try someother type of Hard Drive software such as HD Driver.

I too have a STE, but have never had a problem with hard drives.
Your posting reminds me also of a problem with some STEs using hard
drives when the computer was first released.
The problem is mentioned on the cover of ST Informer Number 38, August
1990. But at this time, according to the article no one knew for sure
what was causing the problem.

I don't have any other Issues of ST Informer that covers this and was
wondering if anyone knows exactly what the problem was?

Was it indeed a hardware problem that had to be fixed such as bad
DMA chips?

The article mentioned that a estimate of 10 to 20% of the STes shipped
in the US had this problem at that time. And that the problem wasn't
only limited to the STe's in the USA.

Hi folks,

I have had a version of Ghostscript installed on my Falcon and it
worked very well once I got it setup correctly. The Speed wasn't bad
either on the stock Falcon if ran in plain TOS 4.04 16color mode.
Nice program and worked with all the PDF files I tried with it.
Can be a bit hard to get it setup. And takes awhile to get the hang
of using it.

Seems I do remember that I couldn't get it to work in Geneva/NeoDesk
and that it had to be ran on a certain partition with the default
settings. I believe it looked for the files on partition E or G. Can't
remember at the moment since I have replaced the IDE that I had it
installed on and haven't moved GhostScript over from my backup partition
yet. Also believe I used the ST version on the Falcon.
Printing worked very well also.
I'll check and see if there have been any updates since I installed it
last. I found it very useful and hope it will continue to be supported
on the Atari Platform.

11. Whats this Dongle For?

Newsgroup: comp.sys.atari.st
Date: 1999-10-01 00:00:00 UTC
From: phantomm@kih.net
Message-ID: <7t1lcc$q1k5@news.ajou.ac.kr>
Source record: 72806

Years back when I bought my STE used, I received alot of misc stuff
with it. One thing that that came with it and have never been able
to find out what its for seems to be some type of cartridge Dongle.

It has a very small hard black plastic case that cannot be opened.
The only label on it is white and states to "Insert Key This Side Up"
on it.

It is the smallest cartridge device I have ever seen. Even Atari 8-bit
cartridges are larger. Yet it does fit perfectly into the STes/Falcons
Cartridge port. It's only as wide as the STes cartridge port and is
around 2 1/2 inches long. The case is very thin also, only about
1/2 inch.

There are no audio/video inputs/outputs or any kind of
ports/connections on it other than the cartridge port connection.

I'm almost sure this is sometype of protection device for a software program.
Anyone know what program it could be for?

It came with the STe, so the software probably is for the ST line but
not sure on this.
Maybe sometype of Music/MIDI software protection?

I'd appreciate any names of Atari ST-Falcon software that uses a cartridge
protection device such as this.

Note that TOS has no influence at all on how a hard disk drive behaves.
Either you're using an outdated driver or (more likely) something is
wrong with your termination or cables.

Hi

It sounds like a dongle, but also could be another application. The word
'key' makes it in my opinion a dongle! If it's smaller than a cartridge,
like the ripper ones, then I don't think it could hold 2 PROM's!

If you get stuck, drop me a line and I'll send you a program which will
help me work out what it is:) and maybe what program it belongs to.

Hiya

I wasn't aware that hard disk drivers were protected, it could be that
you may have a disk gone bad!

I can always have a look at the disks for you!

>
>My Syquest came with ICD software (5.4) but it refuses to talk to anything
>else but an ICD host adapter. The Syquest has one but of course not the
>Mega Ste.

I've used ICD's software on many makes and sizes of drives, although the
version I use it 6.?.?. If you want to use ICD software try and get the
latest version:)

>
>Anyway, my question is: Is there any HD driver software someone can

>two PowerMacs but still use some of the ST software and would like to keep
>my ST setup running smoothly.
>
>Any ideas?

I have used HD Driver as this allows me to transfer data between my pc's
and Atari's using a hard drive, EZ drive and Magneto drive etc...

I have also used it on many devices and sizes of drives so you shouldn't
have a problem.

On the PD/shareware side of things:

I also have tested ADHI (Atari's hard disk drivers) without too much of
a problem, you must use the loveable 'folderxxx.prg' with it.

There are is another good one but can't remember what it is, slapped
wrist time:)

Thanks all for the feedback.
If I'm not speaking too soon, the Cubase lock-up problem looks solved.
Guido suggested I check to see if the HD light stayed on from a crash.
It did'nt but it led me to check the HD configuration with HDPARTS (ICD).
Sector size was around 16k. HDUTIL (also ICD) showed 32768. I dropped it
down to the next step (16384) and Cubase now seems to be OK!!! Fingers are
still crossed!

Hello Jim,

Thanks for posting this info. I downloaded dogspin.zip and it
has gotten corrupted. My original Zip file checks out fine and
the size of my original file and the corrupted one is the same.

I didn't download videosn1.zip but I'll take your word that it
to is corrupted.

I'll rename them and upload them again. Martin and whoever else
maintains the FTP site should remove those 2 bad files whenever
it's possible.

Thanks for letting us know,

Hi

I would like to buy copies of ST Applications, Atari Computing magazine, the Atari magazine produced by Compo (sorry cannot recall the title) and any other Atari mags not mentioned.
Please let me know what you have available and how much you want for them.

Thanks

Paul

For faster service, Please direct all replies through E-Mail to Ben at:
atari@benjamin.net or bensmith@teleport.com instead of NewsGroups as I
find it hard to keep up with NewsGroups.

I've added more and will be adding more Hardware, Software, Books and
Accessories for Classic 8 Bit and Atari ST. So checkout what's new on
my WebSite. InFact check it regularly as my Catalogs are updated
regularly. I have 6 different Catalogs, and my SoftWare Catalogs are my
largest. They have the biggest Byte Count. And remember if you can't
come see me today, come see me tomorrow!

also, if you live in Portland, Oregon, interested in Atari and want to
meet with other Atarians. Read the Ad near the bottom of this message.

Click for WebSite!

FREE Catalogs for Classic Atari 8 Bit & Atari ST Computers! Hard-
Ware, SoftWare, Books & Accessories! View Atari Catalogs on the Web at
http://www.atari.benjamin.net And Jump to my FTP site linked to my Web
Site so you can Download Free Catalogs or FTP directly to my site at:
ftp.teleport.com/vendors/bensmith/ If you can't get Catalogs that way,
Feel free to Request catalogs through E-Mail. Really, it's not an
inconvenience. I do ask that you specify Atari 8 Bit, Atari ST or Both!
Then I'll send them to you by E-Mail Only. Not Snail (Postal) Mail.
Please let me know if I can attach text files to your E-Mail. Catalogs
are just regular ASCII text files so you can download them into your
text editor and view them, edit them or print them out! It would make
things easier for me if you take my Catalogs, load them into your text
editor, delete what you don't want and E-Mail me the rest! To expedite
things, include your complete Mailing address so I can figure your
Shipping/Postage & Handling. I'll be back after the weekend.

If you have an Atari and live in Portland, Oregon. U.S.A. or vicinity,
you are cordially invited to attend a Meeting of the Portland Atari
Club. You don't have to be a member to attend. We meet the 2nd Tuesday
of each Month. Our Next meeting will be Tuesday, October 12th, 7 pm
at the Pizza Baron at 2604 S.E 122nd Avenue in Portland, Oregon. Get
together with other Atarians. Make friends, meet new people, maybe find
an old friend. Eat Pizza, drink Pop & Beer in a decorative atmosphere.
Bring your family to a family friendly place. For more info try:

http://pac.pdxweb.net

e-mail: atari@benjamin.net

For more information or directions, please call our Vice President
Ben Smith at (503)256-9974 See you there!

Please Direct all Replies Through E-Mail to: atari@benjamin.net or
bensmith@teleport.com. If you can't reach me at benjamin.net see my
E-Mail/Web info in my Signature at the Bottom!

Yes. Why not use CBHD? This is freeware. A modern, fast driver. v5.02 is the latest release. If you want english RSC and docs. have a look on Derryck C's site.

I can't swear to this, Steve, but does Spin need some .INF file which points to the config file? (A bit like StiNG which needs a pointer to its s/w bundle).

HI

I'm getting a crap newsfeed ATM, so didn't see Nick's (Nick B???) original posting, so apologies for using Phantomm's message as the base!

On 1 Oct 1999 06:46:21 G, Phantomm wrote:

(Nick's bit:)

>>This is a great idea. Such a great idea that actually I had it a few
>>years back, but never got down to doing it.

Always wanted to do it in AC, but never got the time really!

>>What I would like to suggest is, once you have this great big file, to
>>make it available in some form on the web. This won't hurt any sales for
>>AC, since you are quitting, and would be a great service to the
>>community. Heck, I guess someone could even volunteer to maintain it!

No problem about making it available anywhere in any form TBH. The original idea is that it forms a reference point for non-online readers of AC, hence the rush to get it as complete as possible before the middle of October so that it can appear in AC#16. After the initial publication in the magazine it can go up on either my web site or somewhere else where it has a secure home. I think it sensible to have it in one place on the web, one place for ftp, and also make it available by email from me or some other volunteer to anyone that asks.

After initial publication in AC#16, there's no reason why the updated file can't be made available in print as long as postage costs are covered. HTML and print versions can easily be handled using Papyrus 7 (if I ever get it!), and straight ASCII can also be generated easily.

>I was thinking of the same thing myself. :)

I'm open to offers of help!

:-)

>It would be a big help to all Atari folks if you could make this info
>available on the web as a text file. Especially those who won't be able

As above, no problem.

>to get the last issue.

No reason why most people can't get a copy of the last issue is there?

>I hate to see AC go BTW, and wish all that made the mag possible the
>best of luck.

Cheers, it was a hard emotional decision to make, but you only need to see the costs and time involved to realise it's not a good idea to continue any longer, apart from which the AC team really need a break to recharge the batteries!

:-)))

There's been a fair response so far, but I know it could be much better, so if anyone has suitable info (even if you think I know about it already!), please send it anyway!

Thanks to all that have already sent in stuff for entries - all very relevant and useful!

:-)

Kind regards

Mike Kerslake

Use Spin or ExtenDOS to access the cd rom device.
SPIN034.TOS is free, take it from the homepage of julian reschke.

After install the driver you also got a desktop icon.

>
>ATB
>Steve

We have 4 Pioneer DRM604X machines and one DRM1804X machine
on our 260 ST, which operates our BBS. We are using a Advantage
Pro from ICD with Metados. We wrote our own CD changer driver
for Metados. Or rather, adapted the one that came with the ICD
stuff. But these are not very new. We have been running these
for years. With the one single CD drive, we have 43 CD-roms
on our BSS. These machines are stacked. Since they do not
have a fan, they heat each other. The glue for the rubber ring
on the disc table does not like this, and then the CD's stick
to the table and the changer jams. Anyway, if you are not
stacking them, they are nice machines. Although the 1804
is making trouble lately.
Fortunately, we had another 1804 as backup, and we always
have a couple of backup 604's. We also have a PC with
wildcat now. Since the MS-stuff does not support 43 drives,
we have a problem. On the other hand, we decided to get
a couple of multi-gig hard drives and simply copy all the data
from the CD's to a hard disk. This is a lot cheaper, and more
reliable. Why would you still want to use changers with the
current prices of gigabytes? 20 gigs costs about $250 now.
That is 30 CD's, I am pretty sure a changer costs more.

Keep those ST's humming.

34. Atari Chat Session Saturday night!

(Assuming you mean me, from the conversation, apols if not!)

I'm not actually a programmer, unless you count small-time database
programming with macros in MS-Access (*sharp intakes of breath all round* -
hey, a person's gotta eat!). When it comes to the real thing, as it were, I
couldn't program my way out of a paper bag, TBH. I am, however, eternally
grateful to all the programmers who've made using Ataris so much fun for so
long and continue to do so.

> Was it indeed a hardware problem that had to be fixed such as bad
> DMA chips?

Yes. My hard drive (Ladbroke DataPulse) came with a test file: an IMG of a
pattern. You copied it to the drive and back and if it showed corruption as
a result you needed a new DMA chip.

> The article mentioned that a estimate of 10 to 20% of the STes shipped

No, it affected STEs in Europe too, at least in the UK.

> in the past, is there many improvements? Any information would be
> appreciated.

There were some changes from 3.58 to 3.62 (?) which I can't remember off hand, apart from the introduction of a bug which stopped it working under MultiTOS due to memory problems. This was removed again by the time 4 came out!

From the update manuals:

New in 4:

* Internal code rewritten to bring about major performance improvements (IIRC they re-wrote it in C, previous versions developed in GFA)

* Redesigned 3D user interface

* Colour picture support using EFMS picture loaders (as used with TruePaint/TrueImage)

* Colour print facilities with dither routines

* Keyboard shortcut-based text macros

* Multiple page previews

* Support for 16-bit character sets

New in 5:

* Paragraph numbering

* Arbitrary object angles (including text)

* Text object lines with attributes

* Alternate cursor shapes

* Horizontal and vertical guide lines (a la DTP)

* Context-sensitive pop-ups

* Enhanced mail merging

* Create document (speeds up creation of mail merge, TOC and index)

* Open copy function

* Enhanced RTF import/export

* Fill and line attributes for picture objects

* New dictionary

* Open existing document as a template

* Line breaks in addition to paragraph breaks

* Improved searching; now includes tables and anchored objects

Starts up quicker and some bugs ironed out but still some problems
with the fancier printing options. The English Papyrus 7 is said to
be due out RSN.

Incidently did you know that you can tailor the keyboard shortcuts
to suit using a file editor on the RSC file? Experiment on a copy
only!

A defective DMA chip was shipped with the first STE release. Atari offered free replacement, but as many never used it with a hard drive, they did not know they had a defective computer, so some of them are still out there. But as mentioned in an earlier post, if it works with smaller hard drives, the size is not an issue. Those STE's corrupted any hard drive.

Hi Mr. FannTumm,

I (temporarily) have C-Lab's "Notator Alpha" which has a copy protection dongle that's grey, 2" x 2" x 5/8". It has a slightly indented area on the top for the decal which measures 1-3/4" x 1-1/4". Maybe the dongle you have is another one of C-Lab's programs... maybe Notator, or Notator SL?? Just a possibility.

Oh, by the way.... this "Notator Alpha" is for sale if anyone is interested. Wasn't that a smooth transition? ;-)

It's 'Kobold' (one 'b') and in the UK from System Solutions. I am
currently translating Kobold 3.51 for them, which (at last!) will handle
long filenames. They hope to have it at the Stafford Atari show.

There is also HOLD_IT.PRG for the AUTO folder, which retains text on
screen if your press the Alternate button. But note that it will not
stop scrolling with long messages, so only the last screenfull will be
visible. It's freeware and part of the IdeaList package.

Do you get the same problem if you specify 21 as the driver to print to? (Edit the assign.sys as necessary). Some progs don't like using any driver other than that specified as 21 (I'm not saying that this is necessarily the case with STFax).

>
> <chop>

MiNT has its virtues, value for money being one of them, but as always
it to me remains the domain of unix savvy people of which I am not one.

The complexity of trying to setup MiNTnet or similar is an overhead of
additional complexity that many Atari users cannot be bothered with. I
also think that the MiNT community has some sort of grudge against the
MagiC community, always complaining that ASH are the Microsoft of the
Atari world and that MagiC therefore sucks. MagiC has its bugs but one
thing it has that MiNT and its compatible GUI shells will never have is
outright speed. In that regard it is a winner over MiNT for many of us,
but rather than take sides why cannot the authors of MagiC and MiNT
learn from each other? Just think...the speed of MagiC with the stable
running of MiNT, all bundled together in a package with a comprehensive
GEM based install frontend. Food for thought surely?

Kind regards,

Chris Wilkinson, Christchurch, New Zealand.

The only thing I use a dongle for is C-Lab Notator v3.0 (music MIDI/notation software). The dongle is a "key". Without it the software won't work. Yours? - dunno. I can only assume it's a key for something. If you're not having any trouble with any of your software, then chuck it back into your desk drawer. Hmm, hope that was a little helpful - not trying to sound patronising.

Good luck,
Guy

GhostScript is what you need, available for most platforms including Atari.
Free, too. Will strip text out, convert to various file formats, create PDFs
too. I think features vary slightly between versions.

From recent discussions here on this very topic:

> TOS!! Any ideas, anyone?

Because, afaik, it's a feature of the XFS extension, available for
MiNT and Magic and not for single Tos.

Bye,
/Pascal/

Oh well, nevermind.. I use MagiC mostly anyways, well, except for demos
and games. So not a problem, thanks for the reply.

Steve

64. Atari Sale--Near Peterborough UK

Newsgroup: comp.sys.atari.st
Date: 1999-10-02 00:00:00 UTC
From: Geoff Ash <geoffash@btinternet.com>
Message-ID: <7t54ca$756$1@uranium.btinternet.com>
Source record: 72762

FOR SALE: NEAR PETERBOROUGH UK.

ATARI 520 ST upgraded to 1Meg. (new internal disc drive fitted)
Philips CM 8833 Colour monitor.
Unused external disc drive (boxed--cost £74.95)
Spare Atari 520 St (needs internal drive) but otherwise ok.
Massive amount of games and utilities, many in original boxes.
Joysticks, mouse (mice), all leads, spare discs and manuals.
Will demonstrate working before sale.
As space needed you can have the lot for 60 UK pounds

Email me at geoffash@btinternet.com with your phone number if interested.
This is a genuine sale but at this price no offers please and buyer
collects.

No, SPIN takes the config file from the AUTO folder of the current (=
boot) drive.

HS-CDROM.BOS is part of a commercial package. Please delete it unless
you are a legal user of CD-Tool.

Replacing it by SPIN_SD.BOS (and running with a SCSI driver installed
as described in the documentation) should work much better anyway.

It's "A:14", not "A=14". Same for the other line.

I might decide to publish a SPIN.DOS driver which would enable reading
of HFS CDs under SingleTOS (it's ready, but right now I don't have any
time to prepare a public release).

I suppose I could, but I've only got a teeny little PS3000. I doubt
high resolutions (>320x240) are usable on ST monitors. Besides that,
I've got plenty of S/VGA and Mac-style monitors around here; I'd gladly
behead my PC so I could have a decent screen for the Falcon... :)

I suspect the conclusion was based on the same old Atari version
of what most people think Multi-TOS is. The past few MiNT releases
have improved the speed issue so I really don't think some magic
user is trying each new mint kernal. The other issue is the GUI
and any speed problems surely come from Atari's AES, as N.Aes
most definately resolves any problems in this area. I also don't get
the "unix" mentality, I use MiNTnet and the whole deal and I don't
deal with unix anything. Sure I had to tweak some "unix" like config
files when I installed it, but that was it. At the most I could count
the number of files on my fingers. Anyway I do not deal with unix
like commands on a daily basis like some would like us to believe.
If you need some serious networking then magic basically chokes.

77. Hard drive question

Newsgroup: comp.sys.atari.st
Date: 1999-10-02 00:00:00 UTC
From: James Pinson <jlpinson@dundee.net>
Message-ID: <7t5k78$en5$1@adonis.tdi.net>
Source record: 72775

Could some one help me solve a hard drive mess I got myself into? I stupidly deleted CONTROL.ACC from the AUTO folder, and when I next rebooted, the computer started to boot the C drive then threw bombs across the screen. I knew immediately what I had done, but I can't seem to find any way to copy the file back onto the hard drive since the hard drive won't boot but it must be turned on before loading a boot disk into drive A or Drive C won't be recognized. See the circular problem here?
If I merely try to reset or switch the computer off and on, the Desktop comes up minus a recognition of Drive C. Not only that, it won't even read Drive A or B if Drive C is on but it can't read it. I can switch the hard drive off, reboot, and then the computer will read Drive A or B, but of coruse it then can't copy CONTROL.ACC to the hard drive.
So is my hard drive now just a doorstop or what?

79. Mega Ste up in smoke-new hard drive needed

Newsgroup: comp.sys.atari.st
Date: 1999-10-03 00:00:00 UTC
From: Alyre Chiasson <epinoche@nbnet.nb.ca>
Message-ID: <37F7A179.A155064B@nbnet.nb.ca>
Source record: 72695

It would appear that the video chip blew in my Mega Ste, I actually did see some smoke but it may have come from the monitor because it went too. Fortunately, I had bought a spare mother board a few years back when Toad had them on sale and I have a second mono monitor. However, it appears that the hard drive took a hit too. The new mother board seems to work, although I can format my hard drive and partition it, as soon as I copy any files, all kinds of corruption problems show up. This applies using my Link II or the internal adapter. My Link II wasn't plugged in when the machine went so it shouldn't be damaged. My conclusion is that it is the hard drive.

Has anyone installed any particular model and brand name of HD that would work with the internal Atari scsi adapter? I don't think our local computer store would appreciate me testing their various scsi drives. I am somewhat concerned about having to turn parity off via jumpers, my understanding is that new drives do this via software. I also have a link II and ICD software. Can anyone suggest me a combination that will work? I would like to keep the drive internal if possible.

Thanks

Then you haven't installed it properly. There must be a SCSI driver in
the system (refer to the documentation for details).

>
> Steve and I could not get the SPIN_SD.BOS to work hence the solution
> up above.

Well, it's certainly possible to get it working -- a lot of people are
using it. Please do not use pirated software just because you didn't
have success running the other one instantly.

If HS-CDROM.BOS does work and SPIN_SD.BOS does not, there is certainly
a problem with the SCSI driver:

a) if you are using HDDRIVER, please contact Uwe Seimet and make sure
that the CD drive is configured to be seen my HDDRIVER,

b) otherwise, SCSIDRV (out of the CBHD package) should be installed.

Please refer to the documentation for details.

Not really, as I haven't used the more recent versions of the Atari port.
IIRC it's memory hungry, though: do you have 4 megs? Though TBH if it works
in a fixed window, I doubt it's a memory problem. I'm clutching at straws
here. maybe someone who's used the most recent version can help. Derryck?

What AES were you using? I use Geneva with Mint, and it actually seems to clip along a bit faster than just Geneva by itself, when in turn works much faster than Single-TOS. I've heard that NAES works even faster. This is on a standard 16MHz Falcon, and it seems nice and quick to me. I have tried using both AES 4.0 and AES 4.1, and these are extremely slow, so if you are basing your comparison on these AES's it's pretty much an unfair comparison. Of course, I've never used Magic, so I can't speak for its speed, either. I'm not posting this to further split the Magic and Mint camps, I just would like to know exactly what setup you are using to compare with.

85. HELP! Mintnet won't DeTar!

Newsgroup: comp.sys.atari.st
Date: 1999-10-03 00:00:00 UTC
From: nameerf@flash.net
Message-ID: <j2PJ3.1240$0l6.3079@news.flash.net>
Source record: 72701

Hello!

I am having the worst time getting the file Net-1_04.tgz
unpacked. I successfully boiled it down to net-1_04.tar, but when I
try to detar it using STTAR.TTP, it creates a wierd extra folder named
'-.' and crashes. I also tried the GNU/Mint version of Tar, but it
seems to just crash. This happens with every version of MintNet I've
tried to download from different FTP sites. This is using Mint 1.15
with Geneva 6 and Thing 1.27.
Please don't tell me to get the KGMD distribution. First of
all, I would have to re-organize my hard drive structure which would
be a week's work right there. I would then have to download Megabytes
upon megabytes just for the relatively few files I would need. If that
was what I had to do, I would much rather save my time and stick with
STiNG. Any suggestions? Can someone maybe get the files, detar them
for me and mail them to me in LZH or ZIP format (I am rather annoyed
with the hassle of all this tar.gz stuff). Thanks!

this was an after production start fix. If you add one of the speedup kits,
i.e., Adspeed or Fast Tech boards, at that time, and only at that time you
will remove it.

Ok, I'll take a look and if it's illegal then i'll delete it. But this now puts me back to square one again - using Spin how can I read Mac HFS CD discs? (I wish Extendos could..!)

> Then you haven't installed it properly. There must be a SCSI driver in
> the system (refer to the documentation for details).

Done all that. Extendos can see the CD Drive @ ID 6 and the "illegal" driver mentioned above can see it also - but the standard driver within the Spin archive cannot. :(

Don't forget that there are two 'families' of the ICD software. The
normal one *only* works with ICD host adapters, like AdSCSI, but the
'Professional' version works with all adaptors and the Falcon's SCSI
bus.

Hi Chris

You're using Mint right? Then try Metaxbs.prg instead of Metados.prg.
I have three drivers installed HSMAY.DOS, ISO9660F.DOS and SPINSD.BOS
and I can read Mac disks without any problem.

Furthermore - if you want to be able to print from Cubase, go for a laser printer that's HP compatible, since there aren't any drivers around which handle new inkjets - and NVDI can't be used with Cubase for other things than accellerating the graphics... :(

Using the MiNT versions, put GZ.TTP along with TAR.TTP in the
same folder. You can keep the tgz extension.

Btw, the gz part means the tar archive is compressed using gzip,
after it is tared together, so you need gzip to unpack it.

The usual syntax to _unpack_ is (using a ttp):

-zxvf filename

...which respectively mean: gzip, extract, verbose, folder.

***

To _create_ a tar.gzip, replace the x with c (create):

-zcvf archive.tgz file1.ext file2.ext ...

...which compresses the files or folders file1.ext, file2.ext ...
into a file called archive.tgz.

Hi Paul,

PW>I had a similar problem with XBoot overwriting my Newdesk Inf file.
that's quite normal, if the NEWDESK.INF file belongs to the files
being updated each bootup time.

For it copies the selected file to the root directory.

So the "original" file (e.g. in the XBOOT folder) has to be changed.

Peter

I am not really commenting on the piracy side of things. I know that
if I had got problems with something like this then I would have gone
back to System solutions and asked for then to replace the copy. No
doub't they would have charged something for doing this so perhaps
thats why he is trying not to do this although I very much doub't it.

ANYWAY as I say not my problem.

What I will comment on is Magic Pc not being expensive. It bloody
well is. I know!!! I had the first copy sold in the UK and without
NVDI it was quite slow . I have had good use out of it but I still
maintain that ASH should have allowed the sale of Magic PC for 50 quid
and they would have sold bundles of the program. At over 250 quid it
was not power without the price at all.

Way back when I remember playing a commercial version of the classic Star Trek game. In this version they had added a lot of detail, and instead of just going around blasting away you could also tractor in the ships and return them to starbases for extra points.

I also remember that in some modes it displayed a 2D side view of the ship that showed things like damage. It also tracked morale, and at suitably low values you could have a mutiny.

Does anyone remember anything about this game - like it's title? I can't remember much.

Message-ID: <199910032010.a59756@su2.maus.de>
Source record: 72725

Hi Steve,

S>It's from Metados.. <?>
no, it's from CD Tool. METADOS is free, (c) by Atari, and Julian got
the right to develop and spread it, if I'm right.

S>The driver that comes in the spin arvhive doesn't even see the cd drive
S>at all.
You only need four files: METADOS.PRG, CONFIG.SYS (both in AUTO
folder), one *.BOS and one *.DOS file (anywhere, the path being
declared in CONFIG.SYS) each. Following my CONFIG.SYS:

```
==================================zip=========================================
; CD-Tool BEGIN
; Note that everything up to `; CD-Tool END' will be erased by
; CD-Tool's configuration tool!
;
; created by CD-Tool 2.14, Sat Mar 29 22:39:42 1997
;
; devices
;
; SCSI 4: `TOSHIBA CD-ROM XM-3401TA' -> A
;
; BOS drivers
;
;*BOS, c:\metados\hs-cdrom.bos, A:12
*BOS, c:\metados\spin_sd.bos, A:12
;
; DOS drivers
;
*DOS, c:\metados\hs-iso.dos -c256, Z:A
;
; CD-Tool END
```

```
==================================zip=========================================
```

You see that I use SPIN_SD.BOS, the line before being inactive. When
launching MagiC, I deactivate (by XBOOT) METADOS and use METAXBS
instead, the file file SPINMAGC.XFS residing in
C:\GEMSYS\MAGIC\XTENSION\.

Please be sure to put the correct number (SCSI ID of your CD rom
drive)! The "12" in the "*.BOS..." line results from adding my SCSI ID
(4) to the max number of possible SCSI drives (8). The file listed
above was created by CD Tool automatically so I didn't care. But if
you provide a handmade CONFIG.SYS, you should insert the right ID
(e.g. 13 means 5).

Final remark: Your drive should be "found" by any idcheck program,
even from the ICD program called IDCHECK.PRG in absence of an ICD host
adapter!! These programs only scan the SCSI, maybe ACSI and/or IDE
too, buses for the physical presence of a SCSI device, independent of
a correct METADOS installation.

A few years ago when I had my first ST, I installed a Real Time Clock module (From Dallas Semiconductors) inside my ST. Now that I have got another ST, I want to do the same. The program was called AREAL or something similar, and it came as a auto-load program which automatically retrieved the time and date from the module and set the ST's time. It also had an accessory which set the time initially. Does anyone know where I can get the program from, AND the installation instructions??? I have managed to get an old version of the program, but it hasn't got the installation instructions for the module with it. The files I have are called ar20boot.arc and ar20set.arc. Can someone out there help me, please!

thanks in advance.

From: Freek Munniksma <munkie@xs4all.nl>
Message-ID: <7t73jv$3o0$1@news1.xs4all.nl>
Source record: 72779

I�ve got a 14 Mb Falcon with FPU, external scsi HD, sample clock and (recently) spdif.I had a Quantum prodrive 425F which worked fine,but was a bit slow and too small(425Mb) for serious HD recording.
I bought a Seagate ST32155N secondhand and everything seemed to go well, until i tried to mix a recording. A mono track on track 1 starts playing back on track 1.Stop the "tape" and resume playback: the track plays back on channel 3! And so on:channel 5,7,1,3....It�s enough to drive you crazy!!!!
CAF is the ONLY program having trouble with this disk! I tried just about everything in my HDDriver setup, but nothing worked.If you have any suggestions, please mail me.

James,

Deleting CONTROL.ACC should not affect your hard drive's boot operation. If the drive itself isn't damaged, you should be able to manually get back into it by running your boot software from floppy (AHDI.PRG if you're using Atari's hard drive software). Then create a new Drive C icon on your desktop and reinstall the autoboot software -- use HDX.PRG if you're using Atari's software). Most likely, you have a corrupted boot file on your hard drive.

If you have a corrupt file on the hard drive that is interfering with proper booting from drive A, boot the system with the hard drive OFF, the turn on the hard drive and run AHDI after the drive comes up to speed.

Also check for bad sectors on the hard drive with a diagnostic program, once you're back into it. Good luck.

Sheldon

Ahm, I had some trouble using it (Mega ST+TOS2.06). Well, it works in a way,
but any attempt to resize the console window by mouse leads to that window
shrinking to a single square which can not be manipulated further. In the
end, I edited the configuration file to make a window of usable size
and positions, and it has to stay that way.

Any suggestions?

I would appreciate it very much if someone would be kind to make a brief explanation (or point to one somewhere else) of ALL parameters in the STiNG's DEFAULT.CFG file: what is their physical meaning, required relations of their values, and how they may affect system performance. STiNG documentation is unfortunately very lacking in this point.

The reason I ask this is that i am having trouble using STiNG 1.2, so I am stil on 1.15: with V1.20 everything works fine except sending LONG (more than, say, 100KB) e-mails from Newsie. It seems that the communication gets garbled in that case, and I have noticed that the send/receive LEDs on my modem blink very differently than in successful e-mail sending. On the other hand, the annoying 30s delay before sending e-mail from Newsie, that so many people reported, disappeared with STiNG 1.2

The problem of sending long e-mail remains even with DEFAULT.CFG copied from STiNG 1.15, yet V1.15 worked fine.

Oh, yes; it seems that STiNG gets the MTU=1500 information from my ISP regardless of local settings.

And btw. after several unpleasant incidents I have found out that STiNG was responsible for occasional "write fail" errors from my ICD disk driver. After increasing the "delay" in STiNG.CPX from 20 to 40 the problem disappeared completely.

Best regards;

I did not know that HS-CDROM.BOS was part of a commercial package as
I got it straight off a CDROM which supposed to contain PD and
Shareware software.....is MetaDos free? thats where it came
from.Anyway if I knew it was commericial I would not have sent it to
him.

>Replacing it by SPIN_SD.BOS (and running with a SCSI driver installed

This Falcon makes me wonder tbh.. I also cannot get the cpu cache to
enable upon boot up. I can disable all Auto programs and all cpx's
(except System Info) and cache still isn't on. Really crap tbh :(
Wish it was like Tos 3.06 where the cache option is in the menu bar,
then it can't not enable it upon boot up! Oh well...

The driver that comes in the spin arvhive doesn't even see the cd drive
at all. Whereas Extendos does.. (but this cannot read Mac discs)

From: bjr@localink4.com
Message-ID: <rvgstr2omom53@corp.supernews.com>
Source record: 72645

Just my observation...

On a Falcon 030...Stock w/14meg in VGA.

I've run Mint up to kernel 1.14b
I've run it with Geneva (not real stable)
I've run it with AES4.1 (Stone Cold Slow, unresponsive)
I've tried some other AES options out there as well.

Here's what I ran into under Mint that made me decide give MajiC
a try.

Many programs that work just fine under normal GEM/TOS, or Geneva/TOS,
had horrid key delays under mint. I'd go to type into a text editor
such as Editress for instance, and the character wouldn't show up for
sometimes several seconds (yes with NVDI). I'd report such behavior
to various supporters of mint, and I got over and over that the
software is BAD! Don't use it! So, I'd try another application,
such as QED...same sluggish behavior (thoe true, not quite as bad as
Editress). I'd tweak a zillion things in my set up. Still...awful!
About the only thing I could use was TOSWIN2.5. Now the stuff that
runs on the console, or in TOSWIN rocks! But anything under
GEM...and I'm pulling my hair out at how slow it was. Click a window
gadget and go make a cup coffee while I wait for it to react.

Also, under Mint, I still found that my serial ports were bugged at
higher speeds, constantly dropping charcters and what not if I ran in
higher VGA resolutions. I found that it hogged a lot of memeory. I
found a good many bus errors on booting (what's up with that?) that a
reboot would usually fix.

Well, why not at least TRY Majic?
So I did...

Here's what I found...

Things run smoother...very responsive.
I can actually enter data into CAB forms with my keyboard under MajiC!
A very frustrating task under Mint...where I'd often have to hit a
key at least 3 times before it would take (despite the key click sound
occuring every time). I found that I could set my serial speeds to
57k and faster and stay in 800X600 256 color mode without problems.
I found that the boot required MUCH LESS time and memory. I found
that there is actually a NICE telnet client in progress, that
supports FULL vt102, with the proper emulation codes to split screens
and scroll, with nice extras like cut and paste. I found that things
were smoother, faster, and much more stable. I found that when there

might be a program that just insists that it doesn't like MajiC, it rarely brings the entire system down...you can at least back up your work and reboot (if you are smart) after a misbehaved program bombs out.

I found that with stacks such as STing, it was easy to set up redials with multible numbers and user accounts...something I never quite mastered using chat and pppd (thoe I'm sure it's posible if you know enough about chat, and the utility it is communicating with).
I found that under MajiC I could have entire desktops coustomized to different users that automaticly point to different user dial up accounts and other set-up info (I know this is possible with Mint as well). I've found that MajiC also offers powerful scripting abilities (like crond for mint). I found that with BNET, I could mount all my Atari's over MIDI/LAN/Serial ports, and access them right from the desk top via an icon. I found that all I had to do in order to set up a little LAN over one modem to the internet was give each machine an addy in one simple text file tell it where to pass packets of another ip addy, enable IP masqerading, and I was in buissness...with very easy to use ftp and http servers that blow my mind at how little memory/processor power they require. I've enjoyed the simple GEM remote dialer that can be enacted from any station in the LAN without having to log into a shell with the right permissions and so on, in order to establish a conection over the modem.

I found that MajiC is really smooth, FAST, and responsive, even with several utilities running at once...such as a Ray Tracer...a back ground DSP based audio file playing, and browsing the web all at once.

I found that my system doesn't make me wait with a busy bee when the hard disk or floppy is being used (BGDMA).

Well...in a nut shell...other than high end networking issues, and some of the security issues addressed by minix/mint, I can't find any real advantage for my user style to put up with the sluggish nature of Mint on my system. It really is higher stress, and often takes MANY more steps to accomplish the same task as MajiC (unless you REALLY Study Mint well, and build and coustomise and debug user friendly scripts and figure out how to set them up on your desktop somehow..etc..which I for one have been working on my set up for ages and never got it to my liking).

The one thing I've really wanted as a TOS user for a long time now, is a decent VT102/ansi terminal for telnet...one that is proper, works with STANDARD vt102 term caps, supports the colors and the chimes and scrolls...can cut and paste...etc...At this time, Teli for MajiC is as close as it gets! I wish it were for STing rather than Connect, but maybe Connect will be BETTER in a short time...and a GlueSTik type socket is due out soon for Connect. At least it's 'progress'.

Don't get me wrong Mint Developers. I much appreciate your efforts, and where you priorities have been in software development. It just

don't fit my style as user. I don't need a server...I need a WORK STATION.

MajiC may not be any faster..but it sure FEELS faster, and is much less stressful on the eyes. I can sit in front of MajiC and USE the hell out of it for MUCH longer without getting a major migrane. It seems to be much smarter in how it deals with pallets and whatnot. I can pretty much enable all my favorite auto utilites and cease in keeping up with 50 different set-ups for each application. Task switching is a BREEZE. Booting takes much less time....maintinance is simply a matter of backing up the system from time to time, running a defragger, and updating the clock every once in a blue moon.

Finally, I've found that even alot of software compiled for Mint and take advantage of symbolic links and such, will also run under MajiC since it now supports standard a drive U.

So...YES...I'll agree that Mint is superior in issues of privacy, security, and other multi user issues. I'll agree that it's not very hard to set up...an hours read in a good unix source book makes it very clear and easy to set up in my opinion. I'll agree that it is ultimate in flexabilty for the Atari user if s/he wishes to compile the massive libraries of POSIX/UNIX utilities out there (I've yet to get one to compile myself...they ALMOST ALWAYS report dozens of functions not found in the Mint LIBS and require you disable functions or rewrite them...well...I dunno how to port things...so it does me no good anyway). I'll even agree that under N.AES Mint just might be just as fast, if not faster than MajiC, and adhere to standards better, (how the hell do I get anyone to sell it to me?).

No offence...I just got tired of it...
I'm not trashing my Mint Set UP yet!
Still love to use it for a few things...
It's just NOT a workstation that fits my user style/needs.
In fact, I put off trying MajiC until version 5! Now that I've tried it...I use the other stuff less and less each day :)

MajiC is easy to use...fast...responsive...designed with the end user in mind to keep things as stress free as possible.

Bench marks and junk like that might not show any difference, but I'll tell ya, at least on my system...it seems that MajiC makes much more efficent use of the Hardware than any version of TOS/Mint ever has. On my Falcon at least...screen draws are faster, more responsive...my printing is at least 30% faster, my serial ports work reliably at faster speeds, my keyboard is much more responsive with GEM applications, I get way fewer bottle necks when multitasking, and every day I find a new list of things that just plain WORK BETTER now.

Finally...please realize that I'm aware of how powerful and flexable Mint can be. With time, paitence, and understanding, it is possible to coustomize one really neat work station environment where

everything is only a click or two away. All I can say really is this. GET A DECENT AES that is readily avilable (commercial is okay) and supported in all languages, and offers a good variety of preconfigured work station set ups...with scripts and whatnot that are well documented and easily coustomized, and you'd be on the right track. I for one have no problem with text based set-up and config files...AS LONG AS I HAVE A CLUE what is in them etc...and I can easily set the mess up so it's just a matter of clicking an icon or selecting a menu option to achieve my results.

Your AES is the problem...
They SAY N.AES is really good.
I often wonder if it even exists!

After many emails and even a fax or two, to various places all over the world...

And also my Dealer claims to have tried very hard to get any kind of distribution rights to the the package (but they won't do buissness...guess who is moving MajiC as quickly as he can stock it now?). I dunno...if they don't wanna sell it to me...I'm sure not going to go to any more trouble than I already have trying to aquire it.

While I'm no fan of MicroSoft...I will agree %100 with the ideal that AVILABILITY is a top priority for users. When I can get MajiC ordered, installed, and up and running in a matter of 48 hours, and N.AES is still some grave mystory...a heavily guarded treasure that only one or two places can sell, and don't seem very enthusastic about selling it, and even if they do manage to respond, it's an expensive matter of overseas wait times to obtain it and service it...well...forget that mess!

Brian

This is obviously a problem not related to HDDRIVER. HDDRIVER doesn't
even know what tracks created by CAF are. This is nothing a hard disk
driver has to care about.

XHDI is not a driver in itself but a standard some drivers fulfill.

It should work though you won't be able to use or configure special
features of your ZIP, e. g. password protection and sleep mode.

Hi All

I am in the market for an Atari,I am not a new user I have owned a Falcon, TT and the usual STE's etc I have not used an Atari in anger for at least three years! What I would like to know is should I opt for a second hand Falcon or purchase a new Milan Clone? I will use it for everything from browsing the net, wp, dtp, games etc.

Have any users bought a Milan Clone? What are their experiences etc?

Any advise or help would be appreciated.

Thanks in advance.

Paul

Which AES did you use? The old MultiTOS-AES, the built-in AES from TOS or what? All of these are absolutely horrible under a preemptive kernel, as they...

a) ...do a lot of busy waiting, which in the case of MultiTOS eats up about 50% of your CPU-time.
b) ...likes to stay in supervisormode for long periods, which prevents taskswitching under MiNT and (AFAIK) MagiC.

You should try Geneva or N.AES, neither of these have any of these problems. On my Afterburner the CPU is idle 95% of the time when MiNT/N.AES just "sits there".

You'll find that the latest version is much easier to install. Some folk went so far as to go into earlier versions of the GS binary with a disk editor to change the default drive - however, the true secret was (IIRC) to have the partition assignments set up in the GEM environment, using an Auto folder prog to install this if it wasn't already supported.

>ran in plain TOS 4.04 16color mode. Nice program and worked with all the PDF files

>hang of using it.

If truth be told not all PDF files can be read, but you'll have better luck with this version than older ones, as it has the most uptodate PDF reader.

There's a rather nasty bug (in Pap5) if used with NVDI5. There's probably more, but the one which bites one straight away is the loss of character spacing when used at 100% magnification. There are ways round it, but I would definitely advise waiting for Pap7 to be released.

>Incidently did you know that you can tailor the keyboard shortcuts to suit using a
>file editor on the RSC file? Experiment on a copy only!

If you run MagiC (and perhaps MiNT too, but I don't have experience here) you can do the same with many other progs using a RSC file editor, even add keyboard shortcuts to some which don't already have them.

AFAIK, Kobold 3.5 only handles LFN partitions by automating the switching to GEMDOS mode itself, something which you can do with the earlier version by implicitly configuring it in "Parameters/GEMDOS mode..."

Generally speaking Kobold is a great utility IME, it's routines are lightning fast.

AFAIK, there was only one commercial Star Trek for the Atari. It
featured digi graphics and sound and was Atari exclusive for about 1
1/2 year.
I don't remember the exact name but I guess it was "Star Trek - The
Game".

Hi Paul

I'm a Milan owner and I'm very pleased with it. But if you want to play games you would be better off with a STE or Falc. If you are planning on doing a lot of surfing or dtp, get a Milan for the speed. I haven't turned on my STE since I bought my Milan, but I'm not into games I only use it for "serious" stuff. The speed is said to bee up to 30 times that of a STE. And the sounddepartment isn't to good, it's a lot of tweaking involved, so if you think sound is very important get a Falc.

Hi Paul,
> a second hand Falcon or purchase a new Milan Clone? I will use it for
> everything from browsing the net, wp, dtp, games etc.
>
> Have any users bought a Milan Clone? What are their experiences etc?
>
I have a Milan I 68040. A few machines have serious trouble but there
are quite a few happy Milan owners out there.
Milan is the perfect machine for dtp, internet and painting. The
graphic capabilities are much better than the Falcon and comparable
with today's PC clones.

WP can be done on Falcon and Milan - not a great difference because
Atari WPs are quite fast.

If you think about games you can forget the Milan. The machine doesn't
offer the standard ST resolutions so you have to find resolution
independent games or high-res (ST-high) games. Falcon games won't run
so you are limited to games which run in a GEM window. These games must
also use the mouse or keyboard because joysticks can't be connected to
the Milan.

The standard Milan sound is quite awful (1 channel beeper) so the first
hardware extension should be a SoundBlaster card for the Milan
(MilanBlaster). This card also increases Falcon compatibility so you
can use a few Falcon music apps.

All in all, the Milan is perfect for you if you don't play games or
need Falcon/ST specific apps.
BUT the Milan II is announced and if you consider buying a Milan you
should certainly wait for the Milan II.

Greetings,
Matt.

On 4 Oct 1999 07:45:19 +, J WILKINSON wrote:

->1.12.x is the latest I used...I definately wasn't a MultiTOS dist...

That is pretty old. The latest beta is up to 1.15.3b...

->Running the AES under TOS (with NVDI lurking around!) moved graphics
->at breakneck speed. Why when I add the pre-emptive kernel does the whole
->shebang turn to cold molasses?

I think we are getting to the crux of the matter here. Correct me if
I'm wrong here, but you installed MiNT, then ran the AES included
with the 1.12 distribution? Small wonder then, that it is so slow,
and buggy. You *must* use another AES such as N.aes. Only then could
a fair comparison be made to MagiC...

->The setup is what I was refering to. There is quite a bit of unix in
->the setting up of many MiNT programs. Refer to Katherines original
->list of softwares running on her machine...many are from the unix
->world. I'm a GEM person myself and find dealing with text files to
->alter configs a laborious and excessive task...

I too, find having to alter various text files a pain in the neck.
TBH though, once I did a few right after the initial installation,
I've not had to do much else. When I boot up, I go to a GUI, I
work/play there, and when I'm done, I shutdown from there. I could
not imagine spending all my time at a command line, even though it
does offer some advantages.

->I used STiK under MagiC originally, and when the connection was
->stable (not often as you could realise!) pages could load as
->much as 2-3 times faster into CAB as they would under MiNTnet.
->In particular the loading of graphics/converting to screen of
->graphics was MUCH faster under MagiC. To say it is MagiC that
->is choking is unfair, as the TCP/IP stacks available are still
->unreliable...it is they that die on the user, NOT the OS. I have
->had MiNT hang more often on the net than I have had MagiC hang,
->which says to me that at least when a TCP stack died under MagiC
->it didn't take the whole system down...

If you were using the older AES (4.0/4.1), then its no wonder
you had hang-ups. That really is a buggy AES. ;-)

Catch ya later!

->faster. This is on a standard 16MHz Falcon, and it seems nice and
->quick to me. I have tried using both AES 4.0 and AES 4.1, and these
->are extremely slow, so if you are basing your comparison on these
->AES's it's pretty much an unfair comparison. Of course, I've never
->used Magic, so I can't speak for its speed, either. I'm not posting
->this to further split the Magic and Mint camps, I just would like to
->know exactly what setup you are using to compare with.

Methinks he was using the old Atari AES that was included with the
MiNT distribution, which explains a lot. You really must use N.aes
with MiNT to get optimal results.

I have a question about a statement you've made though. The part
about Geneva and how it "works much faster than Single-TOS". I'm
confused about this. I've got the latest versions of Neodesk/Geneva
and I'm currently using N.aes/MiNT/Thing, and I can honestly say
that *nothing* touches single-TOS on my Nemesized Falcon for sheer
speed. I can run CAB under all 3 and page display/graphic loading
is fastest in this order:

Single-TOS
N.aes/MiNT/Thing
Neodesk/Geneva

and thats not the only example either. Under Neodesk/Geneva, open
a folder/partition that has around 300 items in it. Do it again
under single-TOS. Note a small difference there? ;-)

I'm not being contradictory here, and like you-I'm not trying to
(further) split the MagiC/MiNT groups, [in fact, it bothers me
to see 2 groups who are, after all, Atarians go after each other
with such fury], but these are the results that I get on my
particular machine. Oh well, just my 2 cents worth as well...

See ya later! ;-)

Hi

It's quite easy to do:) Just try and format a disk double sided, or try
and read a disk you know as double sided.

DON'T use high density disks that PC users use.

It was called 'Star Trek - The Rebel Universe' and came with a sow-on
patch. The game was an adventure type, & IIRC had 4 missions or
variation on it.

There was a PD/Shareware game based on the, clear sector theme called
'Star Trek 25th Anniversary edition' that used graphics.

I bought mine from SysSol at an Atari show about 18 months ago (maybe
longer, but it was a few months before I got the PC to run it on). Cost
around UKP 140 with NVDI-PC (and Ease, but no Ease manual and I've never
installed it). Still expensive, but not that expensive.

>I tried it and it just said the Beta version has expired or somthing like
>that so no it didn't work :(

You must set the date of your system, this beta is only avalaible until November.
Aniplayer is a shareware ;-) this beta works without key.
This beta works on a FALCON/TT/HADES/MILAN/MAC, but it's slow without DSP.
FPU isn't used with MP3.
Now I have writed alls stages for MP1/2/3 in assembler, I think write again
last stage for a better speed (for DSP and 68K).
7 stages uses 68K.
2 last stages use 68K or DSP (DSP works in //).
80% of time is used for last stage for DSP and 68K (same problem).
I hope always full D2D on a normal FALCON. Now this beta can play MP3
32 kbits/s in D2D (normal FALCON). With fast bitrate you must use
preload option and a little file (< 1 mn for 44,1 KHz stereo)
for listen this file normally. Another solution is to save in AVR/WAV/AIF.

Didier.

>Why does that not surprise me?? System (ripoff) Solutions was the
>worst thing to happen to Atari IMHO.

The special driver (written specifically for the ATI hardware)
is actually supplied with the Hades ATI Rage cards. NVDI 5 comes
into the equation because this is only a rudimentary video display
driver, with no integration of other bitmap output device management
facilities such as printing (with colour calibration control) and
vector font processing. Both of these are essential services to anyone
using a computer seriously nowadays, which certainly applies to most
if not all Hades users. There's no point replicating the work (and
the amount of work and knowledge that has gone into NVDI is
something most users never see or realise) so they don't. The Hades
ATI Rage graphic card installation goes something like this:

1. Install NVDI 5 and choose ET4000 as the graphics chip
2. Install ATI Rage driver to "patch" the video routines

After doing this and re-booting, a resolution and colour depth
selector appears, like it would have done for the ET4000 but,
of course, now driving the new graphics card. This procedure
with NVDI 5 applies in any case for the reason outlined above
and is not really something imposed by the dealers.

In terms of cost, the ATI card is not much more expensive than
far less powerful equivalents of a year ago. Sure it can't be
compared to current PC AGP graphics cards, which are made and
sold by the tens or hundreds of thousands. However, for the
comparatively microscopic user base of Hades machines, the work
of re-programming the card's BIOS and developing a suitable
driver should put the cost into perspective.

That is rather old.

Now I know you have never seen N.Aes. I tried MiNT as you did, then
never used it. Someone talked me into getting N.Aes and now I use this
setup daily. It really makes that much of a difference.

>> the "unix" mentality, I use MiNTnet and the whole deal and I don't

I'm sure I tweaked under 10 files, I don't "login", I don't see any
unix anything.... boots directly to the fine desktop called Thing.
I do not see a unix prompt unless I want to.

I'm not refering to the port or connection. I'm refering to nfs,
samba, plip, smail, that sorta stuff.

First of all you have to use STinG in order to network anything, cause
I-Connect falls real short here. I still say magic chokes in this
area. MiNT is just more flexible in this one area, simple as that.

> in advance! ;-)

I've had my Falcon for 5 years now, and in that time I have used many different combinations of OS, GUI, etc...

My conclusions come from my first-hand experience of running MiNT and of running MagiC.

I first tried MiNT to get at MiNTnet so I could do the net thing. My 14MB Falcon is an accelerated (32MHz 68030, all else standard) one, and yet even with NVDI I mostly found graphic output to be a little short of dead. I mean why have pre-emptive multitasking if the GEM interface is almost unresponsive even with only a few wee apps running? I'd tried different timeslice etc...to try and get it running nicely but always it felt really sluggish...

I then tried MagiC 4, and suddenly the Falcon came to life! I could use POV-ray (a fave!) in the background while doing so many other tasks at once that it wasn't funny, without much appreciable loss of control of the GUI. MagiC had been reliable and fast for me. The crashes I experienced with it were few and far between and down to 'unfriendly' software. The appearance is also more polished IMHO.

MagiC might be commercial software, and questions might fly about its reliability, but shooting it down, as MiNT advocates seem to like doing, isn't giving it fair cop. I liked the stability of MiNT and also MiNTnet still is probably the most stable TCP/IP stack on Atari, but taking sides is going to prevent both sides from progressing for the good of the platform...

Just my 2 bobs worth...

Chris Wilkinson, Christchurch, New Zealand.

1.12.x is the latest I used...I definately wasn't a MultiTOS dist...

> The other issue is the GUI
> and any speed problems surely come from Atari's AES, as N.Aes
> most definately resolves any problems in this area.

Running the AES under TOS (with NVDI lurking around!) moved graphics
at breakneck speed. Why when I add the pre-emptive kernel does the whole
shebang turn to cold molasses?

> the "unix" mentality, I use MiNTnet and the whole deal and I don't

> the number of files on my fingers. Anyway I do not deal with unix
> like commands on a daily basis like some would like us to believe.

The setup is what I was refering to. There is quite a bit of unix in
the setting up of many MiNT programs. Refer to Katherines original
list of softwares running on her machine...many are from the unix
world. I'm a GEM person myself and find dealing with text files to
alter configs a laborious and excessive task...

> If you need some serious networking then magic basically chokes.

Firstly there is no such thing as serious networking on an Atari.
We only have serial connections at modest speeds to deal with...

I used STiK under MagiC originally, and when the connection was
stable (not often as you could realise!) pages could load as
much as 2-3 times faster into CAB as they would under MiNTnet.
In particular the loading of graphics/converting to screen of
graphics was MUCH faster under MagiC. To say it is MagiC that
is choking is unfair, as the TCP/IP stacks available are still
unreliable...it is they that die on the user, NOT the OS. I have
had MiNT hang more often on the net than I have had MagiC hang,
which says to me that at least when a TCP stack died under MagiC
it didn't take the whole system down...

Kind regards,

Chris Wilkinson, Christchurch, New Zealand.

While I still have your attention... what freebie alternatives are there to HDDRIVER? My Falcon has not yet arrived and I assume that I'm just getting the standard drivers (AHDI? XHDI?)

I plan on connecting an external 500MB HD and my Zip. Will the stock SCSI drivers work or will I need something else? I've got ICD 6.5.7 amongst a box of old ST software--will that work?

Derek

The necessary drivers are spin.xfs (for MiNT) or spinmagc.xfs (for MagiC), they are part of spin034.tos, and the best place for downloads is my homepage (www.muenster.de/~reschke).

1) It is irrelevant which BOS driver is installed, because it is a
feature in the XFS.

2) Just drop in a HFS CD -- that's it. If the CD is multi-mode (like
ISO/CD-Extra/HFS), you might have to force a media change (this is
covered in the documentation).

> > Then you haven't installed it properly. There must be a SCSI driver

So, do you have a SCSI driver (ie, HDDRIVER or SCSIDRV) in your system?
If yes, what does the boot message say? Is the name of the device
displayed on the screen.

There are tons of people on this newsgroup who have this setup working,
they will certainly be able to find the problem. The first step would
be for you to describe the boot messages, and which SCSI driver is
installed. Again, all of this is in the documentation.

Steve,
Try http://aniplay.atari.org for MP3 player. It also shows and plays a
bunch of other pic and sound files.
John
P.S. Let us know how it works for you.

Hi Derek,

I'm using ICD Pro 6.5.5. Are you SURE you have your number right? (6.5.7) I thought I had the last release of that program. ICD should work fine for what you're doing. Try it first, and if it won't do what you want, try a few others. Go to one of the many Atari ftp sites and go to the "hard drive" folder and download some programs to try out. Some are free, some are demos, some are shareware. I've heard (via this newsgroup) that HDDriver is very good, but ya gotta pay for it. There IS an HDDriver demo out there. It is still being upgraded, but ICD is not (as far as I know). Your Falcon should arrive with Atari's hard driver: AHDI. I don't know if it will handle the ZIP, but it WILL handle the external SCSI. Doesn't hurt to try it!

Good luck,

Clayton Murray
Seattle, WA USA

Oups. Sample sounds are loaded in memory at start. And 4Mb is not enough to load them. Well, I will try to make a version, either with disabled sound, or with a better sound management (i.e. loading sound when needed).

I now included VDI output in the current version, and added sound to Heretic and Hexen. It will be available soon.

I have a couple of Atari related auctions going on over at ebay. I have a Sound Off digitizer and a Berkeley Microsystems SCSI adapter up for sale to the highest bidder.

Sound Off:
http://cgi.ebay.com/aw-cgi/eBayISAPI.dll?ViewItem&item=175465257

SCSI adapter:
http://cgi.ebay.com/aw-cgi/eBayISAPI.dll?ViewItem&item=175471622

There is no reserve on either of these auctions.

Brian

> I might even advocate it! ;^)

Hello J. Wilkinson,

*) If you've grabbed Freemint 1.14 last night, I would imagine you would
have gotten something a little more recent, Like 1.15.3 (for example).

*) you have to understand that Freemint has nothing (or so little) to do
with the speed you see when you use your computer, Of course as a magic
user you might not care how a computer works. But in very short, the AES
is one layer (amongst many others). Magic kernel with the AES you used as
in Multitos will be as slow (or close to, down to a crawl, unresponsive
mouse clicks etc). The AES/VDI is VERY important, and I think you can
agree with me that already the 100 USD spent on the VDI layer (NVDI here)
is pretty worth it, no? eventhough same OS, just 1 layer changed.

> MiNT apparently is free. To get an AES that really takes advantage of it
> costs quite a few Deutsch Marks. Therefore it isn't really free. What is
> the story here? Are there ANY free and useful AES/GUI's that can be used
> with MiNT?
Are intrface, THING, JINEE, TWSM2, Freedom, Boxkite etc free?
MiNT kernel is free, as much as Linux, Netbsd, FreeBSD etc are.
And It comes with sources. (VERY important matter)
Now, the fact that you're already not paying the Kernel, you also want all
the applications to be free? I guess a little more realism here is wished.
Xwindow (i.e) has many servers which are NOT free, they are commercial.
Some are free, some are good some are not.
Now, to go back to your question: "Are there ANY free and useful AES/GUI's
that..." , yes there are, free and useful, although slow and/or buggy.
If you want a good thing, the only alternative is Naes.

Now, you said:
"To get an AES that really takes advantage of it costs quite a few
Deutsch Marks"

1)It costs HALF the price of magic.
2)I believe you could help in the free development of oaesis (v0.90 now),
comes with src and all.

Beg your pardon?
"only serial connections at modest speed?"
cable modem ethernet parallel (PLIP) and scsi, LAN.
I think regarding connectivity, we've seen worse.

> > I'm not refering to the port or connection. I'm refering to nfs,
> > samba, plip, smail, that sorta stuff.
>
> As I said, no serious networking. You're talking about threads

> All the above mentioned softwares have their foundation in unix
> which is why they seem to work better with MiNT...the authors
> write them to work under MiNT, with little regard for other OS on
> the platform...
Now Chris, you are going way down in lalaland.
1) "The authors write them to work under MiNT", blah, what is that?? The
authors don't even know what MiNT is. They are writing it for their
machine (linux, sunos, hpux whatever) wishing that the code is
compatible enough to respect the other OSes.
MiNT due to its unix calls and libs just makes things WAY easy. Which
allows MiNT users a great deal of Unix applications, Just ported here, not
rewriten from scratch.
2) don't feel excluded by the fact that you are using magic, it is all the
fault to magic author/supporters whatever, not respecting Atari
choice/decisions. So a big gap has been created.
More over, BSD sockets is a standard (like it or not), even WindowsNT!
What do you do then with STiK, STING, Iconnect, draconis, ppp-link?

Just have to write your own code coz ain't portable. Besides, this
ridiculous situation is EVEN more ridiculous as we don't have enough
programers.
How long did it take for you guys to have icq?
Oh I am sorry with iconnect, don't even have icq yet, (although full src
is freely distributed!)./
How long did it take for mint? the time to compile.
Oups and change 1 line in the makefile.
BTW: micq 0.4.2 (latest) for MiNT is available.

> > I-Connect falls real short here. I still say magic chokes in this
> > area. MiNT is just more flexible in this one area, simple as that.
>
> Why do you say MagiC chokes when it is I-connect that provides the

I can't let that go without putting the other side of the story. I've been beta-testing and translating ASH Software for years and they've alway been helpful and responsive. I usually meet them at shows in Germany and always look forward to chatting with them about new projects. They're probably thinly stretched on the support side - like any company trying to survive in this market.

I'm curious, why were you angry?

As Jorgen said, the Milan is a nice choice.
Upgraded Falcons can also be nice considering
that you can get the Afterburner, Centek, and the
upcoming Tempest board for it. I have considered
that route quite a few times, but currently I am
pretty happy with the TT that I bought a while
back.

But then again, a 200 mhz PowerPC Falcon is
tempting.... :)

The WAD must be the PC ones. Because 16 and 32 bits values
are little-endian. I wonder if WAD for Macs-68k where big-endian.
Well, about Hexen, I corrected many bugs (missing little>big-endian
conversions), so wait for the next release.

Exactly, so why the high cost?

>In terms of cost, the ATI card is not much more expensive than
>far less powerful equivalents of a year ago. Sure it can't be

According to one person on this thread, the ATI card performs worse
than his previous one (ET6000, IIRC), although it can deal with higher
resolutions and more colours. Naturally, that's not caused by the
hardware itself (since it's years newer), so we can only assume that
the driver (which is what you're really paying for) is badly written.

>compared to current PC AGP graphics cards, which are made and
>sold by the tens or hundreds of thousands. However, for the

But it _is_ a PC graphics card!
(Not AGP, though, but that makes little difference.)

>comparatively microscopic user base of Hades machines, the work
>of re-programming the card's BIOS and developing a suitable

Why would they want to reprogram the BIOS?

>driver should put the cost into perspective.

What puts things in perspective is that you can get a driver for
very much the same hardware (RageII) for free, if you go the fVDI way.

For vector fonts and printing that still requires NVDI, but you could
buy the graphics card for $40 rather than $200.
(It should be noted, though, that the current fVDI device driver can't
actually initialize a RagePRO. I'm trying to find a cheap card with
that chip, however.)

Some actual performance numbers might be interesting. I'll go and run
some tests on my Falcon+AB040 with an Eclipse/RageII under fVDI and
fVDI+NVDI and then perhaps others can report how their machines do?

Obviously, my machine _should_ do a lot worse than a Hades/Milan with
a RagePRO since I'm limited by a very slow 16 bit bus to the graphics
card, which is a generation older than the RagePRO.
For reasonably useful benchmarks, a couple of different modes should
be tested. For example:
- 640x480x8bit@60Hz
A really low overhead mode that should should max out the performance.
If your machine for some reason does better in another mode, please
feel free to report that instead.
- 1024x768x16bit@75Hz
A reasonable mode for normal work and standard monitors.
- 800x600x24/32bit@75Hz
A 'heavy' mode. The reason I don't suggest a higher resolution or
frequency is that many monitors (and older cards for that matter)
can't deal with that. If yours can do 1600x1200x32bit@100Hz, it would
certainly be interesting to see numbers, but they can't really be
compared to the more 'normal' modes.
Since both 24 and 32 bit modes actually use 24 bits for colours, it
makes sense to report the one that gives the best performance if your
card can do both.

Does anyone happen to know about any benchmark that uses vector fonts,
Bezier curves or any other new VDI features?
For now I guess GEMBench is about all we have?

I'll make sure tests like the above are added to VDIBench (a new VDI
benchmark program written by Magnus Kollberg and myself) later on. If
time permits, I'll try to fix the current version (there's a bug or two
in there that need to be squashed) and make it available on my ftp site
so that it can be included in the tests.

209. Let's talk about Newsie

Newsgroup: comp.sys.atari.st
Date: 1999-10-05 00:00:00 UTC
From: clu-da-bard@geocities.com
Message-ID: <pChK3.519$PG3.16484@typhoon01.swbell.net>
Source record: 72605

You know, thanks to Newsie, I am able to do
everything that I used to do on a Macintosh.
Beautiful. I left off on a challenge to myself
to see if I could do all I needed on ONLY the
Atari TT030, and the answer is yes, and quite
well. :)

So I check the mail and newsgroups. I have
CAB, but for the sake of the other members of my
Atari club, I would love to get the Web browser
in cab working as a simple browsing solution.

That's problem # 1.

Problem #2... file paths. I think I have
figured that you can create a folder and have all
your new mail go to it. This way, it doesn't
become a bunch of junk in your Newsie folder. I
was curious about the other paths. What is the
WORKING PATH and BROWSER PATHS?

Take care and have a nice day,

Doctor Clu
Atari 800 / TT 030 User

Hiya

I've never tried, but the Falcon keyboard is the same as the ST
keyboard; I'll be corrected if I'm wrong:)

As I recall some blitter chips interrupted to frequent. The chip is a divider that slows down the blitters interrupt line.
It can be removed if your blitter is of the good kind. You will have to reconnect the severed Interrupt line then.

Jim <jtdon@direcpc.com> wrote in message news:37F787A8.E5FACBAD@direcpc.com...
There is a small circuit board on top of the CPU in my MegaST4.
The chip on it is GD74LS74A and the board has C103261 on it.
It is soldered to several pins on the 68000 and has 1 wire running
to a solder point on the motherboard. Anyone know what it is ?
Thanks, Jim

Hey Steve,
My 2 cents,
My Falcon has an extra key (\) before the z key, under the delete key
there's a # key and a few other re-arrangements different than my Mega ST4.
Don't know about the hook-up!
John

The connector on the Mega ST motherboard is the same as on all ST computers. There is a little adaptor that plugs onto it that accepts the Mega ST connector. Just plug this adaptor onto your Falcon connector, and plug in the Mega keyboard.

The problem I've always had, using NVDI with STraight FAX! is not printing
- that's fine, both with my SLM804 and, now, with an HP Laserjet 6L

driver - but getting other programs to "print" to ST-FAX; whereas STraight FAX! provided a Speedo driver for the program, they never produced an NVDI one, that I'm aware of!

I was offered a Falcon keyboard a while back, and was assured that is
was the same as an ST one with the same connector. Let's put it this
way, it'll fit inside the external casing etc... that comes with the
Lighthouse Tower & Desktopper cases!

Monitors for sale

Following my recent monitor failure (these tvs do your head in!),
I've now heard from an Atari-friendly business that are about to
start selling brand new 14" colour monitors with sound for 69.95
UKP. They'll need an Atari-to-SCART lead for connection to ST/Es
etc but they will be doing these too for 14.95 UKP.

By the way, in the past this place had charged 60 UKP as a standard
charge for just looking at your stuff so a new monitor for slightly
more isn't too bad a deal and a bit less than other Atari places have
quoted me. Anyone else interested could give Analogic a call on
0181 546 9575. They also do mice, disk drives (inc. HD ones), hard
drives etc and are located in glorious Kingston upon Thames, Surrey
(without a worry) which is just off the A3 and M25. Atari places
are so few and far between now that I trust you will forgive this
plug - we need these places even more than ever if our fave platform
is to surive into the millennium.

Thanks to everypne who mailed me with stuff for sale.
Cheers and keep the /|\ faith

Al Ferrier

ps are there any free ISPs that do SLIP connection or are they all
PPP etc. as I feel like saving a few bob every month?!

PPS If that guy who was looking to buy Atari amgs is lurking, give me
a shout as I've a load of ST User, ST Review and ST Format for sale
all with their original coverdisks - very reasonable price!

I won't start this debate all over again, but remember - there's a
difference between "easy to learn" and "easy to use".

> MiNT apparently is free. To get an AES that really takes advantage of it
> costs quite a few Deutsch Marks. Therefore it isn't really free. What is

No, MiNT is really free. But if you need/want an AES (most people do, but
I know some that don't) you'll probably want to pay for N.AES.

> the story here? Are there ANY free and useful AES/GUI's that can be used
> with MiNT?

The AES 4.1 beta from Atari is pretty good, but it has some annoying bugs.
It's quite useful (a lot faster than older MultiTOS-versions) if you
manage to set it up properly (it's a beta, so documentation is even wrose
than we're used to from Atari).

And then there's oAESis, which recently was ported back to MiNT again. I
haven't tried this version, but it's still being developed. And it's free.

>> >Firstly there is no such thing as serious networking on an Atari.
>> >We only have serial connections at modest speeds to deal with...
>>
>> I'm not refering to the port or connection. I'm refering to nfs,
>> samba, plip, smail, that sorta stuff.

> As I said, no serious networking. You're talking about threads
> here. Software written bad enough is the problem, NOT THE OS!!

I don't quite follow you... There are several ethernet-solutions
available, but you have to look hard for them... If you have a Hades or
Milan and to a certain degree a TT it's quite easy. And all of these have
MiNT-Net drivers AFAIK, and there's also one or two drivers for STiNG.

But "serious networking" isn't just hardware - when your Atari is
connected to a LAN you'd probably want more than http, ftp and telnet.
Most people that have their Ataris in LANs do this to share disks and
printers with unix- or Windows-boxes. Currently you need MiNT and MiNT-Net
to do this, because there's no support for SMB, NFS or lpd on other
platforms.

> All the above mentioned softwares have their foundation in unix
> which is why they seem to work better with MiNT...the authors

> write them to work under MiNT, with little regard for other OS on
> the platform...

They don't even write them for MiNT (with the exception of the
NFS-driver), they just compile what exists for the rest of the unix-world.

>> First of all you have to use STinG in order to network anything, cause
>> I-Connect falls real short here. I still say magic chokes in this
>> area. MiNT is just more flexible in this one area, simple as that.

> Why do you say MagiC chokes when it is I-connect that provides the
> net working? I think MagiC can handle protocol between apps just fine,

I think he means that MagiC as a *platform* "chokes" when it comes to
networking. And I agree with him, I run MagiC quite a lot on my TT but
it's extremely annoying to have to resort to floppynet just because
I-Connect doesn't support anything else than serialports and then it even
needs a modem connected (can't handle nullmodem-connections).

> and OLGA is a great example. It works like a dream on this Falcon...

OLGA is a particular bad example. It's a good idea, but the implementation
is horrible. It breaks memory-protection (if you're luckyk enough to have
it), and it makes the system less stable.

Hi Folks,
I have NVDI4.something (4.11 IIRC) on my 14Mb Falcon. I've been trying to get it to recognise .TTF fonts from a CDROM of such things that I have but although I have them loaded into the BTFONTS folder it reports that they are <damaged> at boot-up and of course, then won't let me use them from Papyrus Gold 3.62. Obviously I'm doing something wrong....should .TTF's be somewhere else?

I've never complained to much to myself about the speed of CAB's
display routines until I was directed to this site.

http://homestead.com/significantnews/pav.html

The page is java-infested but that's not the problem. For some reason
it paints a full-page background colour and on my TT with Matrix
tc1208 it paints with a single-bristle brush. Scrolling the page up or
down is not something to be undertaken lightly.

Source record: 72692

Hello there,

I've got the latest release of GEMAR but I don't know how to use
it with my streamer. I own a Falcon030 and here are the caracteristics
of the streamer :

*Information written on the streamer :
Hewlett Packard SureStore Tape 5000

*Information provided by HDDRIVER :
"HP 35480A T603 Sequential Access"

*Capacity : 4 GB on a 90m DDS-1 cartridge (using a data compression
ration of 2:1)
*Sustained Transfert Rate : typically 366 KB/s with data compression
*Burst Transfert Rate : 1.5 MB/s (asynchronous)
3.0 MB/s (synchronous)

What are the parameters for GEMAR, concerning the 'Streamer
Adjustments' and the 'Backup Adjustments' ???

Last but not least, how to contact the developper ?

Many thanks !

I just checked--the ICDBOOT.PRG version number is 6.5.7 (Pro) and the file is dated in November 1994. Weird, eh? The latest available is supposedly 6.5.5 Pro according to ICD, as well...

ICD *is* still updating this program, BTW: if you go to http://www.icd.com/ and click on "Atari ST Products", they say that ICD Pro 7 is in testing. I know it's been like that since at least late April.

> ICD should work fine for what you're doing. Try it first, and if it
> won't do what you want, try a few others.

I had a hell of a time getting either CBHD or HDDRIVER to work with my MegaSTe's internal host adapter, but I'm guessing the Falcon's modernized external SCSI interface will be a little less hectic to work with.. :)

The Zip is yet another SCSI device--at most I'll have to stick in a cartridge when the Falcon is booting so it'll recognize the media, neh? This trick works on the Mac when you don't have the Iomega Guest/INIT handy.

In article <37F8742F.4D11@ooc.de>, Uwe Seimet <us@ooc.de> wrote:
>XHDI is not a driver in itself but a standard some drivers fulfill.

Gotcha. I see the author of HDDRIVER has XHDI 1.3 available for download on his... I've not been able to find any information about its reliability, though.

Yes it is, but I tried grabbing Freemint 1.14 last nite. I received
a zip file (lucky, most are pain in the arse Gnuzipped freaking TAR
files!!), but contained within was mostly source code files, and a
MINT.PRG, MINT.CNF and a few readmes. NOTHING was included
in the documentation about how to configure, NO AES was included,
and I said to myself ,'Here we go again...' just as I did the last
time I tried to grab a MiNT distribution from the net...your debate
with me would be MUCH easier if MiNT was much easier to do. Who knows
I might even advocate it! ;^)

MiNT apparently is free. To get an AES that really takes advantage of it
costs quite a few Deutsch Marks. Therefore it isn't really free. What is
the story here? Are there ANY free and useful AES/GUI's that can be used

with MiNT?

> I'm sure I tweaked under 10 files, I don't "login", I don't see any
> unix anything.... boots directly to the fine desktop called Thing.
> I do not see a unix prompt unless I want to.

When I installed MagiC I didn't tweak ONE SINGLE FILE. I clicked a program called 'INSTALL.PRG', which made my floppy and hard disks buzz and whir a bit, then asked me if I'd like to reboot or drop back to TOS. I rebooted into a fully setup MagiC desktop...why can't MiNT ditributions provide that or do they? If they do I'm struggling to find one that does! MagiC also installed in less than a minute!!

As I said, no serious networking. You're talking about threads here. Software written bad enough is the problem, NOT THE OS!! All the above mentioned softwares have their foundation in unix which is why they seem to work better with MiNT...the authors write them to work under MiNT, with little regard for other OS on the platform...

> First of all you have to use STinG in order to network anything, cause
> I-Connect falls real short here. I still say magic chokes in this
> area. MiNT is just more flexible in this one area, simple as that.

Why do you say MagiC chokes when it is I-connect that provides the net working? I think MagiC can handle protocol between apps just fine, and OLGA is a great example. It works like a dream on this Falcon...

Kind regards,

Chris Wilkinson, Christchurch, New Zealand.

Switch completely off, wait 10 sec's for the Harddrive to spin completely down,
switch on again. Press any key as soon as you see a progression bar starting.
TOS will then skip looking at the harddisc, but boot straight from floppy.
Alternat key is the official way, but has never worked on my TT.

The commercial game uses graphics, too. I have a preview article of the
game (1987) here. No typing, just clicking.

Hi all...

was just wondering if anybody is still playing Frontier - Elite II on there Ataris. I've been playing my game now for bloody ages and it really is a timeless game. Even better is the fact that it runs on my Falcon.. with much smoother graphics.

if anyone is still playing this game then please get in touch.. maybe a webpage/user group could be set up if there is more interest.

It is said that the Frontier universe is so big that it is impossible to travel to every system in one lifetime.... an excellent excuse .. if there is a need for one ... to keep my Falcon forever :)

a happy falcon owner :)

regards
Paul Mac

> somewhere else?

No, but inside the NVDI cpx panel remove the option "TEST FONTS" .... it will
then allow
you to use some TTF fonts .... that's I had to do with TTF tibetan fonts.

I bought myself a Yamaha CRW4416S yesterday, and since CD-Recorder
can't handle Joliet I decided to port mkisofs to MiNT (and possibly
MagiC, I don't know yet). However, to do that I need to know the format
of CD-Recorder's image-file. Does anybody have any information on this?
I would guess that it's just a raw image, but you'll never know.

263. Q: About upgrading Cubase? and a few thrown in just for the sake of it....

Newsgroup: comp.sys.atari.st
Date: 1999-10-06 00:00:00 UTC
From: amfreq <metzl@execpc.com>
Message-ID: <37fb3e5f$0$10180@news.execpc.com>
Source record: 72511

I'm a legitimate user(so far as i can tell) of cubase 2.0, i bought it thinking it was 3.0, but well into the purchase i was informed that it was actually 2.0, blah blah blah(he tossed in sound designer universal cause of this, which in itself i'm having problems with, my eps decides to work with it maybe once a week if i leave it alone for that much time, dunno why???), it's really no big deal, but i am curious as to what the latest version of 3.1 improves upon......now here's the thing, i've found(by sheer luck) an ftp that has an archive of i guess the upgrade.......it doesn't mention how you go about upgrading and what the factors for doing so are(looks almost like the contents of my program disk)......but like i said i have 2.0.....and i have a dongle that works.....but when trying to run cubase.prg off the floppy i've copied 3.1 too i get the message.....no dongle....GOOD BYE(another thing, i'm getting lots of these messages "DISK MIGHT BE DAMAGED RETRY CANCEL" usually i notice it when i've coppied atari programs from my pc to disk to be used on the atari, it isn't an original atari floppy, and i wonder if that may be the reason???),! so what's the deal??? i'm guessing the dongles are specific to the program you yourself are using and aren't universal......but no where does it mention this in the text that you have to have anything but a legitimate version.....which version that may be i don't know, it's no biggie but if it would turn out that i could upgrade this way i'd be joyed!!! any suggestions anyone??? btw here's the ftp address,
ftp://ftp.mcc.ac.uk/pub/music/cubase/UPDATES/Atari/

There is a small orange connector, between the power supply and
the VME slot, numbered J803. Pin (1) is the output, (2) and (3)
are grounded. The speaker outputs a mono mix of Left and Right.

I could post the messages I have sent them but I suppose that would
prove nothing.

>I usually meet them at shows in Germany and always
>look forward to chatting with them about new projects.

Well I am sure we all would like to do that but as I said I had ONE
reply from over 20 messages so I feel I am qualified to comment. The
customer is always right or does that not apply to software
companies??

>They're probably
>thinly stretched on the support side - like any company trying to survive in
>this market.

Well to be honest they made a rod for their own back there. Magic PC
could have been BIG, very BIG in fact but they priced them selves out
of the market, especially with the free emulators out there.

I still say,as I said in my message, damn fine software BUT one
swallow does not make a summer. I was finding bugs for them so I

actually PAID to beta test for them and I was ignored. :(((In fact system solutions were no better, I asked questions and they never knew the answer. they always passed me to ASH and as I say never got replies bar the first message I sent. I confirmed the address and still no go.

To be fair after Rob Perry left I found the support at SS left more than a bit to be desired. I could accept this if I had purchased a cheap program but around 250 quid I consider expensive.

To be able to run a BBS for years on Magic PC I found incredible but I always call it as I see it.

I will also give credit where credit is due.....which leads me onto AC.....I understand that the next issue is the last. Well despite being out of Atari for almost 12 months I would like to thank you personally for all the effort you put into it. I have posted Mike direct. Could you also pass my thanks to all who worked on AC as I am sure there are also some unsung heroes as well :)))

Regards Andy T

On Tue, 5 Oct 1999 at 21:56:29 a message from steve green was created on
the subject of STE soldered memory question.
>Hi all, "lucky" Steve has just discovered his STE has the memory (4x256k)
>soldered to the mother board, no quick upgrade there then. Anyone know if
>this affects things like fitting accelerator boards & internal HD's ?

Hi

Well that's the first STE I've heard of that has the memory soldered
directly, I have come across some SIPP memory that LOOK like that!!

If you are 100% that they are not SIPP's, these plug into the
motherboard!!!!

They shouldn't effect upgrades that don't take over the memory slots
etc..

>And It comes with sources. (VERY important matter)

Like Kellis says, MiNT is really for free. If one wish too, it can
be used just with the normal AES. You'll loose some great things
but is usuable.
Tell me how many of the MagiC user uses the Magx (or whatever that
thing is called). I guess 90% of them are using Jinnee. Is Jinnee
for free? The N_AES package is bundled with a registrated version
of the excellent desktop Thing, so one doesn't need to buy a good
working desktop like one must do with MagiC.

>1)It costs HALF the price of magic.
>2)I believe you could help in the free development of oaesis (v0.90 now),
>comes with src and all.

And I would like to add a third point.
3) MiNT can be used on every machine be it a modest ST1040 or a
Milan. Try to do that with MagiC. If one has a Hades one need a
special version. The Milan requires yet another version. I have
a Hades060 and a TT030. This means that if I want to use MagiC
on both I must buy two versions (2x179,-DM)

The installation of the full MiNT/MiNT-net package took me about
25 minutes on the TT030 and 45 min. on the Hades. I just had to
hit install.prg and to anser a few questions. BTW: The new N_AES
version can be installed with Gemsetup and it will hold a GEM
based setup program.

A good example is Chatter. I tried to launch the demo version just
to see how it looks like. All what I got was this warning: 'Fehler
beim ï¿½ffnen von EDITOBJC.SLB! It seems that this product is even
imcompatible with Magic versions <6' as it needs a shared library.
The latest version of Chatter can't be used under plain TOS
either. Nice isn't it? That's the way some Magic "or must I say
ASH' programmers works.:-(This reminds me to the pratice of a
nice guy called Bill Gate$.

I can't see the realtionship either but for your information J.
Wilkinson, Olga works also like a dream with N_AES and so does all
the other (not-only MagiC) protocols.

278. CAB 2.7 OVL

Newsgroup: comp.sys.atari.st
Date: 1999-10-06 00:00:00 UTC
From: tparrett@fast.co.za
Message-ID: <7tg94p$29k4$1@nnrp01.ops.uunet.co.za>
Source record: 72526

I have just installed Cab 2.7 and ask if anyone can advise which Falcon OVL I should be using with this version of CAB. I an currently using v1.3100.
I'm quite dissapointed with Cab 2.7 as I still find sites where I can't save or print the pages. This seems to happen with frame type pages and sometimes with PDF downloads.
Another problem is that when going back CAB will sometimes go back more than one step
I also note a carry over of a problem from 2.5 in that when i do save a page or download a file the SAVE FILE dialog box gets corrupted regarding the filename although in most cases the file downloads OK. Is there a solution to this

I already explained: for developing the video driver and
re-programming the BIOS. If you don't think that's worth
it, no problem, different matter.

>>compared to current PC AGP graphics cards, which are made and
>>sold by the tens or hundreds of thousands. However, for the
>
>But it _is_ a PC graphics card!
>(Not AGP, though, but that makes little difference.)

Of course it's a PC graphics card, and it has been modified
in the BIOS to work on Hades. When no driver is present, for
example when you're installing for the first time or are doing
emergency engineering/recovery work, it displays a simple
monochrome Atari screen and that's an invaluable fall-back mode.

Having said that, what is the definition of a PC graphics card?
The physical hardware interface is generic and open to use
by any non-mainstream platform, but you can't go and buy a
graphics card from a PC shop and expect it to work in your
Hades. The raw materials of hardware are worthless in comparison
to the knowledge needed to design and make it work. If a graphics
card happens to be made primarily for a PC, like they are, it can
be sold "cheap" because many thousands of people will buy it.
Not so in the Atari, and more specifically, Hades market.

>>comparatively microscopic user base of Hades machines, the work
>>of re-programming the card's BIOS and developing a suitable
>
>Why would they want to reprogram the BIOS?

I don't know the details of the answer to that, ask Medusa. All I can say is that I've tried plugging in various "PC" PCI graphics cards straight from the box, and the result is they don't give any picture when the Hades is powered up.

Now consider a professional environment where the food on your table depends (even if partially) on the up-time of this machine. Do you want to mess about working "blind" to perform a diagnostic if there is some system corruption or mis-behaviour, which might otherwise be easily solved?

>>driver should put the cost into perspective.
>
>What puts things in perspective is that you can get a driver for
>very much the same hardware (RageII) for free, if you go the fVDI way.

Fine, respect to that, but does it work with Hades, now? Consider the professional environment again. For the cost of the "official" ATI card which works, now, the gain in productivity outstrips the cost of having an immediate solution, which is by no means unreasonable anyway, all things accounted for. Even if it's twice the cost, it's capable of achieving return on investment within a short time, so what's the problem? There is none.

By all means promote your own work which is not done for profit. However, if you were to put a professional price on the time you spent, you would end up with the same "high" cost per unit if not even more. That is the point, since you are comparing price differential.

If you want to make something for free, that's your choice and it's to be respected. Likewise, if Medusa or other commerical Atari companies want to earn some honest money from selling knowledge, that's also to be respected. These are just two differing perspectives and neither is ultimately superior to the other in the same circumstances. Why should anyone be expected to work for peanuts by default? It's not wrong to put a price on your work and there is a choice. Nobody is forced to use a Hades or upgrade to the ATI card. Can you honestly say you expect to drive a classic car and have all parts and servicing at next to no cost or for the same as equivalents for vehicles in the mainstream market? Sure it's possible if you have all the skills and knowledge yourself, or have all the right contacts, but how many people do?

>For vector fonts and printing that still requires NVDI, but you could
>buy the graphics card for $40 rather than $200.

You could do that, and it won't work.

Not sure. Why do you want to do this? You like the software?
Besides that, you won't do your Falcon justice sampling in
8-bit.

>Also, does anybody have a Replay 16 for sale?

The Falcon equivalent is Clarity 16. A very good alternative is
Zero-X, maybe together with a SoundPool FDI external 44.1/48KHz
sample clock and S/PDIF unit, plus a Line Audio FAD 2/2 to bypass
the relatively noisy Falcon audio system.

> Brian

haha. I love your characterization of nAES being a heavily guarded
treasure! :-)
This is an issue that is very hard for people using MiNT to deal with.
The best AES for MiNT is nAES, yet it is virtually impossible to get.
or very easy to get, depending.... read on
I sent my VISA number to Woller for nAES1.2 and within two weeks I had it
in the mail, sort of. The bill said 1.2, the disks said 1.2, but
nAES said 1.17 when booting up! So I sent email to Woller asking about this
and his reply asked for my serial number, which I sent back, and then I
heard nothing. Why? I have sent other emails with no success. If MiNT
is to become popularized, then the main AES can not be sold like this!
period! It is approaching theft to sell a version of a product, and supply
an earlier version. I can understand if Woller does not want to sell nAES
outside Germany, or maybe Europe, but must he prevent it from being sold

by others?
No matter how good MiNT is, as long as the supply situation continues
with nAES, MiNT is dead, or maybe it would be better to say its user
base cannot grow.(same thing?)
I agree with the things kellis says about MiNT, what Lonny says,
esp. Jo Even :-) but I have noticed that in ALL the replys to Brians
post no one mentioned this nAES problem even though Brian was emphatic
that he would try nAES if he could get a copy, and is it so hard to understand
that he would like to buy a copy from a local(i.e. his country) dealer, is
this not normal?
Everyone skates around this issue? why? maybe I am missing something?

No, switch off font checking and NVDI will then use them regardless,
but if that causes your system to crash and lose work, that's the
risk you take.

The page uses CSS-P, something that doesn't degrade gracefully in older
browsers. At least v4 of Netscape or Explorer is needed.

Hi Paul,

Are you still on the lookout for mags?

I have quite a few of the Atari Worlds produced by Specialist Mags (sister company to Compo),
Includung the fabled "porn" isssue 3 with the pages that were removed for legal reasons (the pages are still left in that is!)

Sorry to announce that the MiNT user base is far from being dead, or
static or whatever you wanna call it. I believe more people are getting
frustrated with Magic crashes, own standard, and poor flexibility, few
releases, low bug consideration reported by users.

ASH and Woller distributing Magic and Naes (respectively) have nothing to
do with the OS itself. Customer service and/or policy should be addressed
to the above.

Now an important fact you have to remember:
MiNT does NOT need Naes.
Naes NEEDS MiNT.

Many people are using MiNT with NO aes at all. (vcons can do wonder
depending the task you need to accomplish with your atari).

> post no one mentioned this nAES problem even though Brian was emphatic

> the TAF guy
> --
> Ken Macdonald

Distribution of a product is another problem, see above with the related
companies.

Now, the fact that virtually no company in the US for example distributes
Naes, in a way I am not surprised.
All I see in this channel, magic, magic, and magic. The good things seem
they will die, not because of their quality, but by their users denying
these products by pre-judge a product they've never tried.
Yet, the thing about magic is that half of these users got a
cracked/pirated/hacked version of magic. So at least they can try, and of
course, never, or rarely register. (I know the names, and won't tell
anyone, but to be honest I only know 1 "ONE" person who legitely bought
magic).

People; if you have magic and using it, ask yourself this question again:
"Should I register it, is magic really worth it?" I can tell you right now
that my thoughts are: pay for it, then you'll get the feeling on how good
a product is.

For people consciensous/honest enough, they then might consider MiNT kernel with NO aes, or the free OLD/buggy multitos.

Few of you all have the balls to admit some of the "hidden" things, which totally changes the scope of such a thread.

2 OS, 2 different price range, 2 different companies, 2 different goals.

If people are complaining about some SETUP.PRG not being existant, a long time ago someone would have created such a tool, This is not a real issue by itself. (naes 2.0 should come with some installer software)

There is a lot to say about this subject, it has started YEARS ago, and still keeps on as of today, I like talking about this topic as it is rather interesting, business/development/marketing wise. Some people might get annoyed by such a newsgroup thread.

Who wishes to continue?

Thanks for reading/ignoring (either ways ;)

Yes, they will work in the US. They are rated for 220v 50hz and 110v 60hz. I have used few british STs here in the US.

I notice the post about ATARI QUAKE and just had to read. I was wondering, how fast does the game run on the falcon? About a year ago I was messing with the port of DOOM (badmood) and was not too impressed. No sound support, was very slow on my Falcon030 14mb ram. Where can the atari quake engine be aquired from? Thanks...

All the key processing is performed by a processor in the keyboard, and all data regarding which key is pressed/mouse activity is sent as serial data to the computer. Thus it doesn't matter what the keyboard layout is, it's just a matter of using the correct wiring.

>Obviously I'm doing something wrong....should .TTF's be somewhere else?

You can put the fonts where you like (the C: drive is best kept for booting - not for data storage IMHO), point to the partition/folder in your NVDI.INF file (root of C:).

Notice the Checkfont flag, with which you can turn NVDI's font checking off (no, really? :-)), but if you're getting errors on all those fonts it could be something else wrong. Here's an extract from my INF file:

```
CHECK_FONTS = 1
USE_MAC_FONTS = 0

FIFPATH = J:\VECTOR\
FONTPATH = J:\VECTOR\
```

Atari Games for Sale !!!!!!!

E-mail : oscar@agra.globalnet.co.uk

Work in all ST/STFM/STE Machines.

NOTE : All prices (noted with the symbol #) are in UK pounds
NOTE : All games are original, NOT copies !

** OFFER : Buy #10 pounds worth of gear and get any single game FREE

List of Productivity Software/Hardware : (#7 each + shipping in pound
sterling)

---
* Devpac III
* STOS Maestro Plus (Hardware Sampling cartridge and software included)
* PC SPEED v1.5 (Hardware and software - requires soldering - ST only)

List of Compilations :(#4 each game + shipping in pounds sterling)

** (ALL BOXED + MANUALS + ORIGINAL DISKS) **
* Giants
(includes Outrun, Gaunlet II, 1943 and Street Fighter)
* Quatro Sports
(includes BMX, Italia 90, Advanced Ski and Pro Tennis)
* Magnetic Scrolls Collection (1 Meg required)
(includes Fish, Corruption and Guild of Thieves)

List of Games : (#3 each game + shipping in pound sterling)

(ALL BOXED + MANUALS + DISKS)
* Baal
* Batman
* Deja Vu
* Driller
* Elite
* F-19 Stealth Fighter
* Falcon (Game + Mission Disk Vol 1)
* Galdregons Domain
* Ghouls 'n' Ghosts
* Gods
* Gold Rush
* Heimdall (1 Meg)
* Hook (1 Meg recommended)
* King's Quest II

* King's Quest III
* Quadralien
* Leader Board (Game + Tournament Disk Vol 1)
* Leather Goddesses of Phobos
* Lotus Esprit Turbo Challenge 2
* Magic Pockets
* Midnight Resistance
* Midwinter
* Navy Seals
* Night Breed
* Operation Wolf
* Purple Saturn Day
* Premier Manager 2
* Rick Dangerous
* Robinson's Request (1 Meg)
* Shadow of the Beast
* Sly Spy - Secret Agent
* Space Quest II
* Space Quest III
* Spy vs Spy (Artic Antics)
* The Patrician (1 Meg required)
* The Quest for the Time Bird
* Transartica
* Uninvited
* Zool

List of Games : (#2 each game + shipping in pounds sterling)

(NOT BOXED ONLY ORIGINAL DISKS + MANUALS)
* Another World
* King's Quest IV
* Leisure Suit Larry II
* Leisure Suit Larry III
* Operation Stealth
* Police Quest II
* Secret of the Monkey Island
* Storm Master
* Street Fighter II
* The Godfather III (Action Game)
* Wonderland

List of Games : (#1 each game + shipping in pounds sterling)

(NOT BOXED, (1)NO MANUALS, (2)ONLY ORIGINAL DISKS)
(1)Manuals are not really needed to play these games anyway
(2)Original Disks, we do not sell pirated software,so don't even ask.
* Alien Syndrome
* Crystals of Arborea
* Hard Drivin'
* Indiana Jones and the Last Crusade (Action Game)
* Oil Mania

* Panza Kick Boxing
* Rock 'n' Roll
* Silk Worm (Boxed but no manual)
* Spitting Image
* Strider
* The Hitchhiker's Guide to the Galaxy
* Trinity
* Trivial Pursuit
* Wrestlemania

It will fit nicely into the vapourware-category, together with other neat
things like the Microbox, Hawk or Barracuda. Centek/Class 4 is the
European equivalent to Wizztronics.

Interesting, Never knew there was a keyboard layout difference between
US and UK keyboards. Learn something new everyday. :)

Anyway, regarding using the Mega ST keyboard with the Falcon mother
board. What I'm doing is recasing my Falcon into a Light House Tower.
I don't have any type of replacement keyboard case for the Stock
Falcon keyboard.

I do not want to remove anything from the Mega ST computer case.
I still want to be able to use it. I have a extra Mega ST keyboard.
However I do need to use the Mega ST keyboard case
with either the stock Mega ST keyboard or with the Falcons
stock keyboard placed into the Mega ST keyboard case.
Whichever would be easier to connect to the recased Falcon.

My first thought was to cut off the Telephone type keyboard plug
from the end of the Mega ST keyboard cable. And then replace that plug
with the keyboard to motherboard connector from the Falcon. But since
all the wires except for one are black on the Falcon side. I do not
know how to wire it up properly. This is what I was asking about when
I ask for info on how to wire it up correctly.

The other way would be to put the Falcons stock keyboard into the
Mega ST keyboard case if it will fit and to lengthen the wires one
at a time on the keyboard to motherboard connection plug.
This is the way I'd prefer doing it.
But I don't know if there would be problems with signal loss if
I lengthen the wires. I have a CT2 v.B Falcon if that makes any
difference about possible keyboard signal loss.

I'd like to have at least 3 feet of sometype of keyboard cable.
So that I can use the keyboard away from the light house tower case.

When replacement keyboards are used with recased Ataris, especially Falcons, What kind of keyboard cable is used and how long are these cables?

Do I need to worry about signal loss due to the keyboard cable being too long?

James,

The 2 UK ST s that I have had used the same power supply I didnt change a thing. The Sparrow that I had was also 220v and plugged into 110v with out any problems. I sure the person who now has the Sparrow will contest to that. A TT that I have also from the UK uses 110v no problem. I know 100 percent that the TT has a auto switching power supply. As for the others the must have a switching power supply too. How else could you explain it. I even have SM125 220v 50hz that some one has put a 220v US plug on that works fine aswell. Maybe the answer is some changed all the power supplys in my STs but I dont think so. They all came from the same Atari software developer and all work with 110v 60hz but, are labeled 220v 50hz UK.

I also know that Best Electronics sells a Best Power supply that is user switch able between 110v 60hz and 220v 50hz. It not impossible most computer power supplies use some sort of switching power supply be it auto or manual.

Thanks for the report, it's a shame that you've got the problem, but a big relief that it doesn't seem to be due to corruption of the English RSC file caused by editing. Your only recourse will be to specify the console size in the inf file and to restrain from resizing it I'm afraid.

...and where might I find this? 1.14.7 was the most recent found by
going over most of the better ftp sites (funet, lip6.fr etc...)

> *) you have to understand that Freemint has nothing (or so little) to do
> with the speed you see when you use your computer, Of course as a magic
> user you might not care how a computer works.

Then again I might care. Especially if minimal setup and speedy operation
of the GUI, software etc...are things to measure my level of 'caring'. It
seems obvious that you are slated against MagiC users by branding me as one
who does not care about the operation of the computer. Why don't we be a bit
less subjective about this, and look more at objective?

I AM at a disadvantage to many, in understanding of the computer, as I
am not
a programmer, but I DO understand the basic principles involved...

> is one layer (amongst many others). Magic kernel with the AES you used as
> in Multitos will be as slow (or close to, down to a crawl, unresponsive
> mouse clicks etc). The AES/VDI is VERY important, and I think you can
> agree with me that already the 100 USD spent on the VDI layer (NVDI here)
> is pretty worth it, no? eventhough same OS, just 1 layer changed.

Yes. I have -ALWAYS- used NVDI...my tests of MiNT and MagiC
are always using NVDI...

> > MiNT apparently is free. To get an AES that really takes advantage of it
> > costs quite a few Deutsch Marks. Therefore it isn't really free. What is
> > the story here? Are there ANY free and useful AES/GUI's that can be used
> > with MiNT?
> Are intrface, THING, JINEE, TWSM2, Freedom, Boxkite etc free?

No they are not. I have never needed ANY of them however as MAGXDESK,
albeit a little frugal compared to some other stuff, is fast enough
and friendly enough for me...MagiC has consisted for me of only things
to be found on its install disk...NO EXTRAS, other than start-me-up and
other share/freeware stuff...

> MiNT kernel is free, as much as Linux, Netbsd, FreeBSD etc are.
> And It comes with sources. (VERY important matter)

The archive I grabbed was called 'mint114b.lzh'. I took the 'b' to
mean binaries, however the entire source was included too. As I have
stated I'm not a programmer so why should I need those sources? The
abscence of source code is NOT important to me...

> Now, you said:
> "To get an AES that really takes advantage of it costs quite a few
> Deutsch Marks"
>
> 1)It costs HALF the price of magic.

Granted. Still everything I needed for MagiC came on 1 720kb
diskette...and it all installed with a couple of mouseclicks.
I'm prepared to pay the price for the reduced user input to
installation...

> 2)I believe you could help in the free development of oaesis (v0.90 now),
> comes with src and all.

I'd like to beta test, although my comments would probably lean
toward an aesthetics perspective...

I looked at downloading it, but it is in a Gnuzipped TAR file. I don't
have GNUZIP or TAR utils on my Falcon, because ZIP and lharc cover MOST
Atari software on the net. Why is MiNT related stuff seeming to be a
big exception? Surely there is no gain (except in small amounts of
storage space/xfer time maybe?) in using GZ and TAR? The rest of planet
earth are happy with zip, lzh...I have found GZIP and TAR a pain in the
past which is why I don't use them now...

> "tweak one single file, I clicked a program called 'INSTALL.PRG'", sure it
> wasn't SETUP.EXE ?

Am I being insulted? I think I am...

> Chris, Ever been to school? College? ever tried to play an instrument?
> You'll see where i am coming from. (hopefully you will)

In answer to the above...yes, I went to school, yes, I have studied at
a university, yes I play SEVERAL instruments and have been paid a lot
of money as a musician over the years, and have been polled as one of
the best instrumental bass guitarists in my local area...In answer to
the question you didn't ask directly, NO I don't think personal and
unfounded quips about ones basic level of comprehension and intelligence
are going to help this discussion...

> > > >Firstly there is no such thing as serious networking on an Atari.

> Beg your pardon?
> "only serial connections at modest speed?"
> cable modem ethernet parallel (PLIP) and scsi, LAN.
> I think regarding connectivity, we've seen worse.

Pray tell, where can I connect a PCI card that allows use of a
satellite link or Jetstream ADSL, or even an ethernet connection?

If there are solutions to the above issues (I KNOW there are) then
why aren't all of us using them? Because they are difficult, no-one
knows much about them (or are keeping quiet), and the cost would
be horribly high!...

> > All the above mentioned softwares have their foundation in unix
> > which is why they seem to work better with MiNT...the authors
> > write them to work under MiNT, with little regard for other OS on
> > the platform...
> Now Chris, you are going way down in lalaland.

Many of the softwares you show will not work under TOS as well as
MagiC. They work under MiNT because of the very reason that MiNT
has it foundation (to a fair extent) in unix. Just look at the
similarities between MiNT u: stuff and unix pipes/processes etc...

It stands to reason that unix software ported to MiNT may not
work properly with TOS/MagiC

BTW, as far as 'lalaland' is concerned I really HATE teletubbies...

> 2) don't feel excluded by the fact that you are using magic, is the
> fault to magic author/supporters whatever, not respecting Atari
> choice/decisions. So a big gap has been created.

Who is 'Atari'? I'm an ATARI user! I use an ATARI machine. Why wasn't
I included in the choice/decisions? I seem to get the impression that
a 'select' group of Atari users are trying to influence the direction
the platform takes. In that way the MiNT community are no different,
from ASH in their selling of MagiC. MagiC isn't really too expensive
either when you look at what you get for your money. Go try and buy
Windows98 to install on an existing PC...see if that is any cheaper!

I don't feel excluded. MiNT just isn't as easy a way into multitasking
as MagiC, for a non-programmer/musician, who mostly uses music software
and APEX media on his Falcon...am I expected to learn programming to get
MiNT working properly? If I feel excluded I fear it is from a small but
vocal section of the platform only...

> > Why do you say MagiC chokes when it is I-connect that provides the
> > net working? I think MagiC can handle protocol between apps just fine,
> > and OLGA is a great example. It works like a dream on this Falcon...
>
> Olga and network? (relation please?)

The comment was passed that MagiC networking sucks. MagiC has nothing
to do with networking. It is software like I-Connect that does all the
networking. I-connect isn't the best piece of software around, but that
isn't because of the underlying OS! The relation is that OLGA passes
data to/from applications just like updated memos are passed around an
office. The protocols observed (VA start etc...) are handled by MagiC
very nicely in the case of OLGA (I have first hand experience of this),
but obviously bugs prevent I-connect from doing so with client software

(CAB/Newsie/aftp etc...)

> I believe we are just 2 type of person within atari community. The atari
> ones (atari corp) and the magicmac, flashy twingies GUI ones.

What is wrong with an attractive and easy to use GUI? Is it some crime that MAGXDESK is easy to use and still looks OK? MagiC for me has never caused enough problems to be a concern. I find it fast, reliable and a lot easier to use than TOS. My experiences with MiNT have been OK, but MagiC does all I need in my Falcon for me without the extra hassle of needing to get too involved with the workings...that is all I want from my Falcon...

> One is more powerful, more flexible, more modern, as fast as the other one
> AND is free.

MiNT is on a completely different tangent to MagiC, although N.aes is a lot like MagicDesk visibly now...is that because the authors of N.aes have recognised in MagiCdesk a useful and attractive GUI option?

N.aes apparently is still THE gui to get for MiNT...does it seem a little horrid to you that your desktop appearance comes from the MagiC world?...

Kind regards,

Chris Wilkinson, Christchurch, New Zealand.

It isn't laziness. I will purchase something if it makes my
life easier...during and after installation.

> .. and magic still chokes at networking which you seem to confuse
> with who knows what. blah...

OK. Katherine took a less than objective approach to replying to my
previous post, which hasn't helped me understand your point of view.
Please can you explain your interpretation of networking...here is
mine...

Networking to me is about many things including...
-the way softwares exchange data with another
-hardware solutions to move that data
-software solutions to control the 'language' each
end of the network uses...
-and more...

What is your interpretation?

Please remember I'm a non-programmer/musician who delves mostly
into music/graphics/dtp with my Falcon, so english would suffice...
not a technical rundown...just a plain description...

Kind regards,

Chris Wilkinson, Christchurch, New Zealand.

> somewhere else?

TTF's can be anywhere, as long as you tell NVDI where (can be done from the CPX). What kind of CD is it? I have previously had difficulty with TTF's grabbed from a Mac. These had to be translated on the Mac using a program called TTConvertor before I could read them on POV-ray for Mac and NVDI running on my Falcon. If the collection is on an ISO9660 CD-ROM, but for MacOS computers then the above scenario could be the case...as you'll be able to read the 8.3 format filenames on the CD even though the files are for the Mac...

You could email one to a Mac owning friend, ask him to find TTconvertor , and convert one, send it back, then test it out. If it works, cool!

Kind regards,

Chris Wilkinson, Christchurch, New Zealand.

>Your kidding right? My Falcons stock keyboard layout is exactly like
>the Mega ST.

No, he is not kidding. That little detail is one of the differences between an American and a British keyboard, and it does not affect only Ataris, but may also be noticed on PC keyboards and terminal keyboards.

The other details that are different: on US keyboards the [#] is usually on [Shift] [3], the [|] [\] is somewhere below [Delete] and the [@] and ["] exchange places- probably all that having origin in the VT100 keyboard.

I guess that the fact that there are "US TOS" and "UK TOS" files to be seen on the net reflects the difference in keyboards.

Cu.

Hi Gordy and Martin

Could it be, that I have defined a HOME path, where MyMail saves
preferences and some other stuff? Version 0.88 works on my machine
so it must be some configuration issue.

Hiya Ken!

Yes, you _are_ missing the fact that most people using N.AES
outside Germany do so using a pirated copy, because they give
up trying to purchase a legit copy and are instead discretely
handed a pirated german version.

Fortunately, not everyone uses pirate copies, but most do, and
until people like Aixit and Woller treat foreign customers as
well as German ones, this tendency is likely to grow.

Such is life in the Atari world, outside the Maus net...

I have not found any problem with this (yet).

It can be that there is no HOME path defined
or
if you do not like to use the HOME enviroment
then add a file named nohome in the mymail start folder.

If it realy is a fault do please send me a mail on
the following address:
erikhall@tripnet.se

The manual can be found online:
http://www2.tripnet.se/~erikhall/mymail.docs/html/mymail.htm

Mymail itself can be found at:

funet, piwo, chapelie (??) etc. all have the entire 1.15.x-series.

> Then again I might care. Especially if minimal setup and speedy
operation
> of the GUI, software etc...are things to measure my level of
'caring'. It

If you're a minimalist then it doesn't matter if you use MagiC,
MiNT/N.AES or Geneva. When you're getting more advanced is does, and
your choice of OS will depend on what kind of user you are.

> who does not care about the operation of the computer. Why don't we
be a bit

Actually, you need tar and gzip to preserve file-attributes, that's why lot of MiNT-specific software is archived with it. Lzh and zip is fine, but not if you're using filesystems where the access-rights and not the file-extenders allows you to execute a file.

planet
> earth are happy with zip, lzh...I have found GZIP and TAR a pain in

If "the rest of the planet" excludes every flavour of unix and a lot of other "obscure" operating-systems (like VMS) you're right...

> be horribly high!...

If you want PCI, buy a computer with a PCI-interface... We're dealing with old and obsolete computers, new hardware is bound to be more expensive than on a PC.

Ethernet-solutions:
* Milan or Hades with PCI- or ISA-cards.
* ST with Panther II and a ISA ethernet-card.
* Falcon, TT or ST[E] with a ROM-port adapter and a D-Link DE600.
* Medusa, TT or Mega STE with a VME ethernet-card like Riebl, PAMs VME or Biodata.
* Falcon with Eclipse PCI-adapter and a PCI-card (although I'm not sure if the MiNT-Net driver actually works with the Eclipse's PCI-BIOS yet).

Expensive and hard to find - yes. But as I said, you own an obsolete computer that's not really supported anymore.

MagiC has all of these as well, but much of it isn't fully implemented yet.

> It stands to reason that unix software ported to MiNT may not
> work properly with TOS/MagiC

And this is MiNT's fault, and not TOS/MagiC??? Get real... I would say that this is one of MiNT's real strengths and MagiC's major weakness. The MiNT-libs are slowly being adapted to MagiC though, so you'll see that most software that doesn't depend too heavily on the OS will work for TOS/MagiC as well.

> Who is 'Atari'? I'm an ATARI user! I use an ATARI machine. Why wasn't
> I included in the choice/decisions? I seem to get the impression that

Ask ASH and Andreas Kromke...

> the platform takes. In that way the MiNT community are no different,
> from ASH in their selling of MagiC. MagiC isn't really too expensive

?? Do you that there's something called "the MiNT mailing list"? This is where the development is discussed, if you feel you have something to contribute with please do so.

> either when you look at what you get for your money. Go try and buy
> Windows98 to install on an existing PC...see if that is any cheaper!

It is. Windows98 is a complete OS, and a lot cheaper than the MagiC/NVDI-combo (atleast for people like me who lives outside Germany).

> and APEX media on his Falcon...am I expected to learn programming to
get
> MiNT working properly? If I feel excluded I fear it is from a small

No. Most MiNT-users are ordinary users, not programmers.

> The comment was passed that MagiC networking sucks. MagiC has nothing
> to do with networking. It is software like I-Connect that does all the
> networking. I-connect isn't the best piece of software around, but

But as a *platform* it really sucks when it comes to networking (I'm not talking about simple dial-up stuff for web, mail and ftp here), and as you said yourself - as a user you don't care about programming or the underlying stuff....

> isn't because of the underlying OS! The relation is that OLGA passes
> data to/from applications just like updated memos are passed around an
> office. The protocols observed (VA start etc...) are handled by MagiC
> very nicely in the case of OLGA (I have first hand experience of

These protocols are entirely independent of the OS.

> but obviously bugs prevent I-connect from doing so with client
software
> (CAB/Newsie/aftp etc...)

I-Connect isn't really bug-ridden, but it's very, very limited. It can only be used for a single dialup-connection, and that's it. It can't even handle a nullmodem-connection, not to mention IP-masquerading or

multiple ports. It just can't be used in a LAN.

STiNG is much better, but just like I-Connect you're f**ked anyway since there isn't any SMB- or NFS-clients/servers for this stack, and even worse, there's very few Ethernet-drivers for it (only Panther/NE2000 and Riebl IIRC). It will allow you to connect to the internet through a LAN though, which can be very useful in itself.

> What is wrong with an attractive and easy to use GUI? Is it some crime
> that MAGXDESK is easy to use and still looks OK? MagiC for me has

Who said that? Use whatever you find comfortable, but a bit of knowledge is always helpful if you want your critisism to be taken seriously.

> MiNT is on a completely different tangent to MagiC, although N.aes is
a
> lot like MagicDesk visibly now...is that because the authors of N.aes
> have recognised in MagiCdesk a useful and attractive GUI option?

Thing (which is shipped with N.AES) has been around for years and is completely independent of MagXdesk. If you try it you'll see it's infinitely more powerful than MagXdesk has ever been.

> N.aes apparently is still THE gui to get for MiNT...does it seem a
little
> horrid to you that your desktop appearance comes from the MagiC
world?...

If you had any knownledge at all about the history of AESes and desktops you'll understand how silly you sound now ;-)

Yo David,

I agree that CAB should be updated, but this web site just isn't friendly
to ANY browser that doesn't use java-script. IMHO it's the web designer's
problem. The source code is terrible for js-less browser's. I took a look
using CAB/iCAB/NetScape. Your right on about scrolling the text with CAB,
but that's just poor html design.

CU,

Charles

If the HOME varible has been set then Mymail should save all its configuration files to this path and when you start Mymail it should look for all the config files in the Home directory.I do remember prevous version used to save the window sizes but it does not work in v0.88.

Anyway,Mymail is still a great E-mail client despite the few problems.Erik has done a great job....keep up the good work,Erik.:-)

Recent versions of NVDI (from 4.x IIRC) can read Mac-fonts as well, but
you'll have to specify this the CPX (there a check-box, "Mac fonts").

However, it might just be poorly implemented fonts. I've had problems
with these myself, but after switching off font-checking (again the
CPX) they worked fine.

Very poor web design! The page that appears with JS looks so simple that it can be simply reproduced using HTML3.2.
On other hand it may be quite difficult to explain such site maintainers why they should support JS-less browsers. BTW, the page should work fine with Adamas except the whole stylesheet thing.

> >The page uses CSS-P, something that doesn't degrade gracefully in older
> >browsers. At least v4 of Netscape or Explorer is needed.
>
> What is CSS-P?

It's a way to position elements using Cascading Style Sheets. Almost anything can be placed in a CSS-P layer and positioned with great accuracy (to the pixel). These positioning layers, depending on what degree they're used, don't take kindly to browsers that aren't CSS-aware.

"Normal" CSS markup -- without the layers -- usually degrades gracefully (or should if care is taken). But anyone using layers is taking a chance, excluding use of JavaScript on the "normal" (HTML 3.2) page that redirects to the CSS-P version. The combination of CSS-P and JavaScript create so-called Dynamic HTML: If a browser supports CSS-P it generally supports JavaScript, so there's no excuse for not using redirection to fetch the CSS-P version.

The page that started this thread wasn't even a worst-case example of how volatile layers can be in a browser that doesn't support them.

As an aside, if any one downloads the music score writing/printing
program, PROSCORE from:

http://www.pressenter.com/~tkelly/

you will need to disable NVDI's font check for the special music
notation TTF font to work.

BTW has any one got a copy of ASTRAsoft's StormTracker, FS. I know it's
still on the Web (Goodman International).

Bob King.

It is available on my site. You have to search a bit to find it. On my
standard Falcon, I have 15 seconds/frame (not frame/sec!). I had a
report that with the CT2 and FastRam, it runs at 3secs/frame.
It is not playable, no sound, just a demo.

Good news:
it is rumored that ID software will release Quake source by the end of
the year, so we just have to wait.

>it, no problem, different matter.

Well, I don't own a machine that could use it in any case (if I did,
fVDI/Rage would have worked on that too ;-).

As always, companies are of course entitled to charge whatever they
want for their product. I've just always had a problem with things
that, IMHO, are way over-priced.

>Of course it's a PC graphics card, and it has been modified
>in the BIOS to work on Hades. When no driver is present, for
>example when you're installing for the first time or are doing
>emergency engineering/recovery work, it displays a simple
>monochrome Atari screen and that's an invaluable fall-back mode.

My problem with this is that it seems an 'artificial' way of motivating
the high price. Having the 'BIOS software' in an auto-loaded .PRG
would only have delayed that fall-back mode a second or two on boot-up
(and you could have it on a floppy for emergencies).
And it wouldn't have required _any_ changes to the card, so the
software could have been sold by itself.

Of course, the way they are doing it is rather piracy proof...

>Having said that, what is the definition of a PC graphics card?

It was you who compared it to 'current PC AGP cards'. Naturally, the
hardware can be made to work anywhere.

>by any non-mainstream platform, but you can't go and buy a
>graphics card from a PC shop and expect it to work in your
>Hades. The raw materials of hardware are worthless in comparison

No, but apart from showing the boot-up logo, you could have got it
to work without changing the card in any way.

>to the knowledge needed to design and make it work. If a graphics

I know exactly how 'difficult' it is to make use of such a card.
Just about everything you need can be gotten right out of ATIs
documentation and example programs. You hardly even need to
understand how the mach64 engine works if you keep it simple.

>card happens to be made primarily for a PC, like they are, it can
>be sold "cheap" because many thousands of people will buy it.
>Not so in the Atari, and more specifically, Hades market.

Again, the only thing _needed_ for the card to be used in an Atari
machine is a small driver for NVDI (or fVDI for that matter).

>>Why would they want to reprogram the BIOS?
>
>I don't know the details of the answer to that, ask Medusa. All I
>can say is that I've tried plugging in various "PC" PCI graphics
>cards straight from the box, and the result is they don't give any
>picture when the Hades is powered up.

You would of course neeed a driver of some kind.
Even a PC needs a driver to make good use of a graphics card (the
BIOS will give you SVGA modes, but you're not likely to be able
to use any acceleration).

>Now consider a professional environment where the food on your
>table depends (even if partially) on the up-time of this machine.
>Do you want to mess about working "blind" to perform a diagnostic
>if there is some system corruption or mis-behaviour, which might
>otherwise be easily solved?

If there was a problem with my card, I'd want to be able to go out
and buy a new one immediately. I would not want to have to rely on
a small company to do special modifications to it.
With a floppy for emergency boots it wouldn't matter if there was
no picture for the first few seconds.

>>What puts things in perspective is that you can get a driver for
>>very much the same hardware (RageII) for free, if you go the fVDI way.
>
>Fine, respect to that, but does it work with Hades, now? Consider

No, it doesn't. I'm still waiting for someone with such a machine, and
the skill to do something about that, to contact me.

>unreasonable anyway, all things accounted for. Even if it's twice
>the cost, it's capable of achieving return on investment within a
>short time, so what's the problem? There is none.

If people want to pay that much for the card, by all means let them.

>By all means promote your own work which is not done for profit.
>However, if you were to put a professional price on the time you
>spent, you would end up with the same "high" cost per unit if not

If I only intended to sell the ATI driver, I certainly wouldn't.
It would surprise me if more than a week was needed to write such
a driver for NVDI (starting from scratch, but using ATIs docs/files).
Perhaps they only expect to sell 10 cards?

>If you want to make something for free, that's your choice and
>it's to be respected. Likewise, if Medusa or other commerical
>Atari companies want to earn some honest money from selling
...
>the other in the same circumstances. Why should anyone be expected
>to work for peanuts by default? It's not wrong to put a price on

Of course. One of these days I'll probably be programming for a profit
as well, and I certainly have no problem with others doing that.
I do reserve the right to be able to point out when people seem to
charge considerbly more for something than it's worth, however.

>or upgrade to the ATI card. Can you honestly say you expect to
>drive a classic car and have all parts and servicing at next to no
>cost or for the same as equivalents for vehicles in the mainstream

Of course not, but that's not really relevant in this case, as I see it.
You apparently have a different opinion.

>>For vector fonts and printing that still requires NVDI, but you could
>>buy the graphics card for $40 rather than $200.
>
>You could do that, and it won't work.

Good point. ;-)
It would have if I'd owned a Milan/Hades and could find a cheap RagePRO,
however. As it is, I'm waiting for someone who does have such a machine
to express an interest in 'porting' the fVDI RageII driver.

On a side note, I just purchased a used Viper 330 (RIVA 128), and hope
to be able to start working on drivers for that in the not too distant
future. :-)

I'm assumming you meant "get the Web browser in Newsie working"

Annoyingly, I haven't been able to get Newsie working except for the
browsing. This could be me, though, for I haven't really studied the
documentation since I have MyMail and CAB running pretty smoothly and
use RemarQ for newsgroup reading. I can say that I didn't do anything
special getting the WWW part of Newsie running and if you figure out
all of Newsie's ins and outs, please let me know.

I've always used the Speedo Driver for STraightFax in NVDI 4 and it works fine. However, how DO you use the IMG driver to print? Only the drivers in the 20's show up as printers, so is the solution to list IMG.SYS twice in the ASSIGN.SYS?

well there you go!
my problem q-funq is the poor programmer. Here a programmer has written
a nice AES, and his 'dealer' hinders/disables distribution. If I was the
programmer then I would not be interested in having woller distribute my
program outside Germany. Unless it is woller who is the programmer?
in that case...
I see now nAES 2.0 is on wollers page. no upgrade prices though. :-(

> Since Geneva is an AES replacement, could MiNT be used with Geneva and
> NeoDesk?

Yes and no. Geneva 006 (demo) is actually *very* stable under MiNT
(1.15.3) on my TT. Neodesk 004 doesn't understand long filenames though,
so I can't use it. And Thing works fine with only Geneva, but not with
MiNT+Geneva. Jinnee is absolutely beatiful with MiNT+Geneva though.

> Seems to me that answer should be yes, unless some bug makes it
> unstable.

Earlier versions of Geneva didn't work well with MiNT, but 006 is very
stable. Quite speedy too. I can safely recommend this as an alternative to
N.AES since Geneva is easier to find and has way better support. N.AES
is better though, so if you can find it...

No, he isn't. I bought N.AES when it was distributed by Overscan, and they
were very quick and helpful.

> in that case...
> I see now nAES 2.0 is on wollers page. no upgrade prices though. :-(

And you expect an upgrade from Woller?? I *still* haven't received my
1.2.0-upgrade, even though I've paid for it over a year ago. Like you I
got 1.1.7.

I don't know how Woller is regarded in Germany, but I haven't heard on one
single satisfied non-German customer.

Hi, I have 5 Atari items for sale. To make things fair for everyone,
I posted them on E-bay, so that everyone will have a fair chance.

Here's the stuff:

Atari Computer Power Supply, +5v, -12v, +12v
Atari Replacement ST Keyboard, BRAND NEW!!!
Atari "Side Board" for 810 computer NEW!!
Atari Power Adaptor Part No: C018187 11.5vdc
Atari 9 Volt AC Supply Part No: C017945

Go to this shortcut to get to my e-bay items.

http://www.elpro.com/img/

All of this stuff is in new or like new condition. Power supplies have been
tested.

Good luck.

Actually, if Medusa put some generic VGA initialization in TOS you would
even get the logo. Apart from the copy-protection issue I really can't see
the point in modifying the card's bios.

Message-ID: <37fceabc$0$25058@news.zetnet.co.uk>
Source record: 72583

Hi Again,

I have now got the 50 - 68 way adaptor to connect my Barracuda 4.1 gig hd in my tower.
Thanks to Don, I am building up a plain text version of the manual and Bob was good enough to actually print the whole thing out for me from the original .PDF file.

I have loads of stuff on Term Power, Parity Enable/Disable, Motor Start, Termination, Write protect, etc. etc, and have used the Default values for all of these (as suggested in the manual).
I have tried loads of alternative ID settings (this drive allows for 0 to 16 SCSI IDs ?), but I still cannot get HD Driver to recognise the drive !

(I probably have too much info - or am too thick to understand it !!!!)

Will someone who is using one of these beasts please tell me which jumpers they are using on their set-up before I pull the rest of my hair out ?????

TIA

Jim

350. FS: Diskdrive for ST's

I have a IBM type diskdrive 1.44 for the ST line of computers, get rid of that crummy Chinon drive and get this one. Has a face plate you still only have 720K of drive but a much more reliable drive, quiet and long lasting. Has a face plate for mounting and it is a Sony so you know its dependable. $13.20 includes shipping to anywhere in the United States. Prepay by money order (postal please) thanks e-mail only. sfpu@scfn.thpl.lib.fl.us

It can be used and it works reasonable well. A friend of mine has used the
Geneva/MiNT/Thing combo for years for his Internet connection.
However I can't recommend it. I think for a better performance you
need Thing though. Neodesk is just too restricted.

Euch, Last year I asked Woller the free update from 1.1.7 to 1.2.0. Some
days later I found the update in my mailbox.

Once the new version is on the market you can alwyas try to get a copy from
AG Computertechnik.

355. Phenix fits where?

Newsgroup: comp.sys.atari.st
Date: 1999-10-07 00:00:00 UTC
From: jlog@zetnet.co.uk
Message-ID: <37fd01ca$0$25062@news.zetnet.co.uk>
Source record: 72589

I wonder if there is any general agreement as to how the Phenix will fit into the Atari scene? I understand from its website that it is considered a new computer with a new operating system which will run Atari programs by emulation. Having said that, there also seems to be an implication that it is a Falcon clone (just as the Hades is considered to be a TT clone).

I don't have any need for music output, video etc (at least at present) but I was intrigued to read that a voice recognition laboratory in Denmark had been involved. If all the audio subsystems, DSP etc could be used in a really accurate voice recognition system then I would be interested. I have tried ViaVoice on a peecee at work and have great difficulty in getting it to recognise 'Yours sincerely.'

Is it by and large going to go to musicians or will there be general applications?

Hi Johan and Patrice,

I downloaded version 0.5 a couple of days ago but I am not having
any luck getting this VDI version working on the Milan.

It crashes the entire system. I tried booting with a leaner set-up
even booting into TOS instead of MultiTOS but it makes no difference.

Help, I need a DOOM fix.

WinSTon is a Windows 95 ST emulator. It's very easy to install, but it's by far not the best emulator, because it's slow and many ST progs won't run on it.

You should try TosBox and PacifiST. Those are MS-DOS programs (but of course they run under Win95/98).

Have a look at http://www.fatal-design.com/desktop/

Bye.

365. SV: About upgrading Cubase? and a few thrown in just for the sake of it....

Newsgroup: comp.sys.atari.st
Date: 1999-10-08 00:00:00 UTC
From: Claes Holmerup <claes.holmerup@swipnet.se>
Message-ID: <E2pL3.630$KV3.1470@nntpserver.swip.net>
Source record: 72398

Hi,
Steinberg changed the key between version 2 and version 3, so you can't use your key with later versions. You simply have to make an upgrade via your dealer. Is your key black or red? I believe they used black ones until the release of version 3 - and then they became red. To my knowledge they currently only ship Cubase Score and Cubase Audio Falcon now, so make sure you have at least 2MB RAM - otherwise you'll have a hard time using Cubase Score.
I don't remember what they changed, but I upgraded at the time and found it worth the money... ;)

Best regards,
Claes

This is from memory so it's not guaranteed 100% accurate but I think that was a 1Mb STFM they tried to re-introduce. Atari priced it at 149UKP and they had hopes to sell them to people thinking of buying a console. The hope was that they'd buy the ST for the small amount of extra cash and get a real computer instead of a purely games machine.

There must be at least 3 legally paid for copies of Magic since I've got one here. It's the only multitasking OS that lets me use GEM and more than 2 programs on my 4Mb STE.

>Whitch OS do have on your falcon? Single TOS?

I have the same, or very similar, problem occasionaly with CAB 2.6- but not
always. When I download a file, the file-selector for specifying location
of received file sometimes does not work correctly- nothing is visible when
I type in the filename field. The characters are received anyway, although
invisible, and the file lands where it should. This is with RAM-loaded
TOS 2.06, STiNG 1.15 and Booklage's CAB.OVL on a Mega ST.

371. TT RAM Question

Newsgroup: comp.sys.atari.st
Date: 1999-10-08 00:00:00 UTC
From: jba4@po.cwru.edu
Message-ID: <37fe548a.886223@news.cwru.edu>
Source record: 72404

Hey everyone! I recently purchased a great new TT system and I had a simple question.

I opened up the HD cas on the side to check the HD type and found a daughterboard inside directly beneath the HD. The daughterboard is copyrighted by Atari and has the model number C300727-001 REV 1. The chips look like they're probably memory chips and one single large controller chip is also present.

Upon reading some FAQs and web pages, I came to the conclusion that this is a TT RAM board. Am I Correct?

Now, when I boot the system, it reports having 4 meg ST RAM but no TT RAM. Is the computer not detecting the daughterboard or something? I apologize for my lack of experience (this is my first high-end Atari). Thanks for any help!

Have you tried Geneva? That's definitely the best multitasking OS if
you're short on memory or disk. If you're a true minimalist you can have
upto 3.8Mb free on a 4Mb ST.

According to my drawings of the TT it is J803.
Pin 1 and 2 are ground the nr.3 carries the soundsignal and that one
comes from a 47 mF that gets it from Q801 together with Q802.
You should be able to indentify those components on the board.

Sounds like a ST-RAM daughterboard. A stock TT has 2 megs ST ram.
The TT daughterboard goes closer to the cpu, on the left side of the
machine. The ST daughterboard is by the hard drive & is easy to
identify since it connects to the motherboard in two places.

Hello Peter,

PS> But I'm afraid no TT will boot with a TOS earlier than 2.00 (maybe
PS> even 3.00?) :-((
No, TOS is able to run on 68030 CPUs since Version 1.06 (2 and 3 are
nearly
the same, 3 has just some specifics for the TT hardware).

Of course, running TOS 1.06 on a TT results in a loss of the specific TT
features of TOS 3, but it works and some games run with it on a TT, which
do
not work with TOS 3 (i.e. F-16 Falcon, Guild of Thieves, Turbo Cup,
Mercenary, Into the Eagles Nest, Dungeon Master, ...).

Yes. I must say after all that bad news about Woller -there was quite some
postings some time ago about this manner, I was a bit suprised too.
Anyway a month ago I've ask him whether a English version of N_AES 1.2.0
would be released or not. No answer. So maybe he was in a very good mood
when he sended me the update.

As told in a previous posting Axel is nice guy but yes he has the tendency
to not reply mails. Why? I don't know. Maybe because his knowledge of
English isn't that good. He knows he may write in German to me so that's
maybe the reason why I mostly get a reply from him but I must say he
didn't replied to my last mail.
Anyway not reply seems to be a German dissease. The only German that
always replies is Ulf Dunkel of Invers.

Which version are you using? You really must use the latest release as the
previous one had a serious problem with graphic cards.

388. HELP: Atari Floppy Port Specs

Newsgroup: comp.sys.atari.st
Date: 1999-10-08 00:00:00 UTC
From: Chris Martin <dark_helmet@bigfoot.com>
Message-ID: <37FE35A2.FF805FE3@bigfoot.com>
Source record: 72421

All,

Does anyone have any information on the 520ST floppy port? I would
be interested in timing diagramings and pin functions. I have a copy
of the WD1772 spec and can figure out most of the pin functions except
Pin 2 - "Side 0 Select", Pin 5 - "Drive 0 Select" and Pin 6 - "Drive 1
Select"; though, I can guess what these do. However, I don't know
the timing.

What I really want to do, and I do not know if it is possible yet, is
connect the floppy port of my ST up to the parallel port of my TT030
or PC and "emulate" the floppy drive. This would kinda be an APE
(Atari Peripheral Emulator, for the 8-bit Atari) for the ST computer.
My disk drive will not last forever, and I want to bypass turning
my disk images into disks if possible.

Anyway, if anyone has any information on the floppy port, or if you
have knowledge of a project like this, let me know.

Thanks,
Chris

That's right, and taking its space is a wider left [Shift] key.
So the US keyboard has one key less than the UK one.

>But I don't know if there would be problems with signal loss if

I'm running a CT2 Falcon with a standard Mega STE keyboard no problem,
and know of four other people doing the same.

In addition to the entry of Joel Cappel, here is the link to the
magnificent ST-Emulator TOSBOX:

http://www.emuclassics.com/tosbox

TOSBOX should be used for business- and graphics-application, Pacifist
is the better choice for playing games.

My Falcon is in the repair shop, Or I would be using Oasis 2.10 to answer
you. I am a registered user of Oasis 2 (the last I think), I never got in to
work with ppp the ICE the connecting program was the problem but it worked
fine with slip. I now use it with a sting connection bypassing ICE by using
Gary Priest's POPwatch and NEWswatch programs to put mail and news straight
into OASIS.

Works just fine, Oasis is for me still the best News/mailreader I have tried
Which is all but the mint based ones, But sadley not any longer
supported....
I even mailed the author to ask if he would release it as Freeware but he no
longer has the means to write a universal key,He tells me.

Well at least you know.

Pete.

I have the following Atari ST Software for sale. Most of the below mentioned disks have Boxes and Docs. Make an offer. No reasonable offer refused.

ST Games:

Cosmic Relief by Datamost
Metal Mutant by Silmarils
Disc by Loricel
Mission Elevator by Euro Gold
MegaLomania by Image Works
Hostage by Mindscape
Their Finest Hour by LucusFilm
StarFleet 1 by Intersetel
Populous by Maxis(Electronic Arts)
Ghostbusters 2 by Activision
9 Lives by ARC
The Simpson's Bart VS The World by Aklaim
Fast Lane by Artonic
LED Strom by Capcom
Dragon's Lair(3 disks) w/manual by Readysoft

ST Utilities:

DVT Hard Drive Backup
Diamond Edge by Oregon Reasearch
Hisoft Basic by Michtron
ST Replay by Microdeal
Hard Drive Turbo Kit by Michtron
The Juggler by Michtron
WordPerfect by Wordperfect Corp.

Thanks!

Dane Stegman

If interested in any of the above items. Email me at:cf943@Freenet.buffalo.edu

Phantomm wrote:-

>Some of you may remember using Oasis with PPP to finally get our
>Ataris on the Net.

Yep.

>The first and last version I used was version 1.35E.

1.35 came out just as I got my Falcon on the net.

>If there are any folks out there that were Beta Testing Oasis,
>let us know about how it worked and etc.

I wasn't a beta tester but it felt like it.

>For some reason the development of Oasis has stopped afaik.

They just gave up I think.

>What I'd really like to know is if any versions of Oasis after
>version 1.35E worked with PPP?

The internet connection part of Oasis2, ICE, was so unstable it was
almost unusable. It was bad enough on my normal Falcon but when I
upgraded it with an Afterburner040 the only way I could get a
reasonable connection speed was to drop the screen to ST-Hi res.
With anything else the errors would just overwhelm the connection.

I am not sure I ever got ICE to use PPP, I had an 'working' SLIP
set up and Demon would work with it so I left it.

>Is there any way one could use STinG with any of the later versions
>of Oasis to get a working Oasis PPP setup?

Using STinG, NEWSwatch and POPwatch from Gary Priest you can
download mail and news which Oasis2, or 1.35 (and NEWSIE in the
case of POPwatch), will use.

I spent a long time, stupidly, struggling with Oasis2's internet
connect, ICE. I finally got fed up and within just a couple minutes
of web searching I had found NEWSwatch and POPwatch. I had a working
STinG setup already. The two progs are quick and easy to set up and
immediately gave me a stable, reliable news and mail service.

I am still kicking myself for not changing sooner. You will not
regret it.

I still use Oasis2 for news but I have switched to aMail for email.
But I still use POPwatch to check my mailbox.

Gary Priest's website is at:

http://www.the-gap.demon.co.uk

Hi John,
If you mean the digital (V90) lines by 'high speed', then the answer is
that a number of people are doing so with both STiK2 and STiNG.
Mail me if you want copies of scripts etc.

Jeff,

The TT ram board is on the left side of the TT mother board. The ram board that is on the left side is for the ST ram. The part number you give I have nothing that matched that number

My TT ram board has a part number CA400312 .This board uses sipps or simms depends on the board.
My ST ram board has a part number CA401059.

>up as printers, so is the solution to list IMG.SYS twice in the ASSIGN.SYS?

The driver which produces IMG format graphics is called IMG.SYS and should be numbered in the 90 series. This is a section from my assign.sys for NVDI4:

```
21 PAGEPRN.SYS
22 ATARILS.SYS
23 STFAXSPD.SYS
;23 HP660C.SYS

31 META.SYS
61 MEMORY.SYS
91 IMG.SYS
```

You should be able to select the IMG driver in the "Device" popup in your NVDI printer.cpx.

Newsreading is NEWSie's best points IMHO, I never had much luck with the built-in web browser which so often lead to a blank display.

>and use RemarQ for newsgroup reading. I can say that I didn't do anything special
>getting the WWW part of Newsie running and if you figure out all of Newsie's ins
>and outs, please let me know.

For newsreading all you really need do is plug your ISP's news server's address into the dialog box reached from Preferences/Server Address...

Subscribing to a newsgroup is obvious, don't forget to save the subscribed newsgroups window from its toolbar. Also recommend setting the number of messages to download to something sensible (that's in Preferences/News reading options) for your first download, then you can up it afterwards.

Once you've got it working it will be much more useful than RemarQ IMHO.

MagxDesk's main drawback for me is that it doesn't cut it as an AVServer. Once you've tried Thing (and especially jinnee) you'll find that you have a much more integrated system.

Will it display PS files OK? If so then ignore the next para...

You need either the TT or ST versions of the main program, plus the font file
fonts1.zip (the other may or may not be needed, probably not), plus the ps-550.zip
fie which contains the overlays (I have the archives ZIPped here, they may be LZH
ones).

Assuming that's all OK and you've got its config file set up properly (I'm posting
mine, which has the fonts folder and cache on other partitions), then all I can
suggest trying is to use the "Output..." menu to save the PDF file out as a PS one
and view that instead? There's a TTP in there too which will help with PDF files.

```

> Ataris on the Net.

Indeed I do.

> The first and last version I used was version 1.35E.

I used it from quite early on, ended up using 1.33 as it was the latest
version where the address book worked under MagiC. in 1.34 and 1.35 it
didn't. At least for me.

<snip>
> For some reason the development of Oasis has stopped afaik.

Oasis 2 was what stopped the thing in its tracks. The authors made
themselves rather unpopular by charging a high shareware fee (30 UKP, IIRC)
for an incredibly unstable program, didn't support registered users
struggling with the bugs and then wondered why they were unpopular, IIRC.

I was one of the lucky ones who stuck with Oasis 1 rather than risk the
money on something I couldn't get to work.

> What I'd really like to know is if any versions of Oasis after
> version 1.35E worked with PPP?

Can't say for certain, but only a few lucky people managed to get ICE (the
online bit) working at all, even with SLIP.

> I've tried to set up version 2.05 and never had any luck.

About par for the course, then.

> But it sure did look nice. I've seen nothing so far that has
> the look and feel of Oasis. Even though we have some decent
> Net software now.

<cynic>
You mean the constant multiple redraws and the perpetual crashes? Or the
novel use of horizontal scrollbars for vertical scrolling in O1?
</cynic>

> I've seen that NOS has been updated?? Isn't NOS part of
> the ole Oasis package?

Nope. Oasis 1 was written as a GEM alternative to the NOS offline utilities, ie SNews and the simple mailer. It was a great leap forward in many ways, though it did have serious bugs to the last, eg broken threading for news articles. NOS was around before Oasis and is still around after it (though it was included in the Oasis 1 archive). Oasis 2 ditched NOS in favour of its own online bit, ICE, which barely functioned except for the lucky few.

> Maybe someone can bring me uptodate on some of this.
> I'd really like to get Oasis up and running again even if its
> the ole 1.35E version. Can this updated NOS be used with v.1.35E?

Not sure about using the current NOS with Oasis 1, though I would have thought it might be OK. I'd be wary, mind. TBH, I wouldn't waste my time on it (Oasis). You'd be far better spending it on a decent offline reader for NOS, ie Okami. Which a) works and b) follows the standards and has *lots* of nice features.

> Is there any way one could use STinG with any of the later versions
> of Oasis to get a working Oasis PPP setup?

POPwatch certainly works with O2, I think NEWSwatch likewise. Certainly I used STiK/POPwatch/NEWSwatch/O1 and STinG/POPwatch/NEWSwatch/O1 for a while before switching to Okami, which has most of the features of O2 (plus a pile of its own) without the bugs. STinG/POPwatch/NEWSwatch/Okami would be my preferred combo, were I still using my STE for mail and news. Okami is a versatile program; you can use it with any transport option which pretends to be NOS (ie POPwatch/NEWSwatch) or is NOS, also various other download/upload formats (I'm referring to the Jos den Bakker versions, here: the original doesn't work with NOS).

> And if the programmer(s) of Oasis never intend to start working on
> the Atari version again, Maybe someone should pick it up where
> they left off. I'd really like to see it come about as it looked
> like alot of work went into making it.

It's probably better left in the ground rather than resurrected. A lot of work did go into it and the authors had a lot of good will and support from users until they squandered the good will by charging a hefty shareware fee for something that essentially didn't work (O2). A shame, but there you go. Last time I checked the author's web site (a long time ago) there was barely a trace of Oasis apart from an intention to port it to Windows, god help us...

> Any Info on this is much appreciated.

Hope I haven't dashed your enthusiasm too much!

You could well be right: I'm working from memory too. Either way, it was a
last-ditch attempt to shift some boxes before they pulled the plug.

I used the word rumour intentionally, as I don't have documentary evidence, just hearsay from what I've read over the years in here (mostly references to bickering on the Maus-net, rather than in the MiNT list). There has been enough of it on and off for me to start believing it, especially when I see just how fanatical *some* MiNT people get, eg all that hubbub about Atari Computing being in league with the wicked ASH because most of the screen shots were taken from MagiC. Pu-lease...

I'll bow to your superior knowledge on this one, but the violations can't be
that bad as it's possible to use some old programs with it which were
written well before MagiC was even thought of. Most of the stuff which won't
run under MagiC won't run under MiNT either. I'm excluding OS-specific apps
here.

> > latter can be extremely useful, but that isn't the point here). In

> And vice versa, I know MagiC-users (only two, but...) who use Mupfel
> and runs a lot of GNU-stuff.

Precisely. People use the OS that suits their needs, on the whole. Which is why the whole OS war thing is largely pointless: both have their strengths and weaknesses. Frankly I'm tired of evangelists on both sides (though I reckon there are more fanatical MiNTies than fanatical MagiCians). Both OSes exist, neither is going to go away in the short term. As you've pointed out there is increasing convergence anyway. Where this becomes an issue is when software is written to only work with one system (I'm talking about general apps here, not system utilities). If it doesn't work on both these days then it's silly. Just as silly as people writing programs deliberately to not work on emulators. This is a small market, why restrict your software to an even smaller potential user base unless it really needs some specific hardware, eg DSP?

My average day on a computer is about 30 minutes if I'm lucky.
I'm afraid minimalism is the order of the day, as time to do
more is lacking. I have had Atari users suggesting to me that
MiNT is for me, yet my experience says it is not, due to the
lack of time I get to use my falcon...

> > who does not care about the operation of the computer. Why don't we
> be a bit

If you are refering to me digging at people personally then you're
being unfair, as not once during this discussion have I done so...

> 1.14b is a beta-version. Actually, all 1.14-kernels should be
> considered betas.

OK. I'll bin the source code for now (I don't even have a C-compiler)
and look at what else I need to get it up and running. Mostly I need
docs to run me thru it, or an install program. Now for something
constructive, where are the best docs to explain MiNT installation?
and can I find a distribution that has an installer?

> You're not quite up-to-date, are you? I have used MagiC since 4.00, and
> even then it didn't fit on a DD-disk.

I had 4.02 which was on a DD disk, or at least the distribution I have
was...

> A lzh-archive was uploaded yesterday.

Thats good. I'm happy with LZH due to its speed and GEM shell...

> Ethernet-solutions:
> Expensive and hard to find - yes. But as I said, you own an obsolete
> computer that's not really supported anymore.

Meaning my Falcon? Shhh! You'll hurt its feelings! ;^)

> > Who is 'Atari'? I'm an ATARI user! I use an ATARI machine. Why wasn't
> > I included in the choice/decisions? I seem to get the impression that
>
> Ask ASH and Andreas Kromke...

They're just another software house, selling another software package.
They aren't Microsoft/Bill Gates, and nothing I've seen of them makes
me believe that they ever will become like that. Honestly is it the
belief of the MiNT community that they will grow into another M$?

> > either when you look at what you get for your money. Go try and buy
> > Windows98 to install on an existing PC...see if that is any cheaper!
>
> It is. Windows98 is a complete OS, and a lot cheaper than the
> MagiC/NVDI-combo (atleast for people like me who lives outside Germany).

Not here. Then again every PC software retailer in this country by and
large limits their software range to M$ titles, allowing M$ to control
to some extent the pricing...I can get NVDI/MagiC for a bit cheaper
than Win98 here...exchange rates may favour me a little also...

> No. Most MiNT-users are ordinary users, not programmers.

Most of the people involved in the discussion (in the other corner of the
boxing ring!) have been programmers. The names I have associated with a
number of prominent software titles currently available. Most of the
folks I know running MiNT dabble in programming in varied amounts...

> > What is wrong with an attractive and easy to use GUI? Is it some crime
> > that MAGXDESK is easy to use and still looks OK? MagiC for me has
>
> Who said that? Use whatever you find comfortable, but a bit of
> knowledge is always helpful if you want your critisism to be taken
> seriously.

Katherine 'suggested' that when she mentioned that there are 2 types
of Atari users, the 'Atari Corp' ones, and 'MagiCmac flashytwingy GUI
type ones' if I remember correctly. My knowledge could be better (I
do admit I'm a non-programmer!), but the basic concepts are there.

> If you had any knownledge at all about the history of AESes and
> desktops you'll understand how silly you sound now ;-)

I've owned and used Ataris right from the STf 'til now. I didn't
just jump on the bandwagon yesterday...

As I keep stating my words come from experience of using both
MagiC and MiNT. In -MY- experience MagiC makes -MY- time on my
Falcon computer just that bit easier...

...end of story...

I don't wish either way. I will just say that I applaud your advocating MiNT. Obviously some Atari users feel strongly about this subject. I've tried not to, but maybe I've failed ;-/

All aside, if ever you are in New Zealand you are welcome to come talk Atari with myself or the local group. I'm sure the reception will be far friendlier than a newsgroup posting ever could be! ;^)

I think -most- fonts I've converted have worked OK once TTconvertor
translates them. I still get the odd one causing mischief as you
correctly point out. Typically the troublesome ones are the ones
you -really- would like to use in Papyrus/Works! :)

Also, I live in the dark ages and only have NVDI 3.02! (must get
that upgrade one day!). Still this version of NVDI, other than
lack of support for very recent printers, does a great job...

> it paints a full-page background colour and on my TT with Matrix
> tc1208 it paints with a single-bristle brush. Scrolling the page up or
> down is not something to be undertaken lightly.

I tried it with Netscrape 4.5 on a PowerMac and it loaded no problem
although heaps of blank page at the bottom does indicate some kind
of funny formatting issue. I did notice the expected file size was
rather enormous considering the modest amount of text and graphics
that actually were displayed, so maybe there is a file attribute
problem, where files are smaller than they say they are, and hence
CAB will wait for non-existant data...

Also, the article about Pavarotti is ridiculous!! If they think he
is going to take up pole-vaulting then they must be tripping on
something exotic! The truth is that he's going to be horizontal
vaulting with young women, not flying in the air over a suspended
fibreglass bar to come crashing down (boy would he!) on a foam
mat... ;^)

ISTR that just before Atari disappeared in the UK they brought out a bunch
of cheap STEs which had soldered memory. IIRC there was some criticism in
the magazines as you couldn't upgrade them easily, so they weren't quite the
bargain they seemed at first glance.

Magxdesk. It's actually very good: I've never felt the need to install a
replacement. My copy of MagiC-PC came with Ease, but I never installed it -
lack of LFN support was the main factor, but I'd used Magxdesk on the STE
for ages anyway. Tried Thing once on my MiNT setup, which was a vast
imprvement over the Atari Newdesk, but never felt the slightest urge to
install it for MagiC. Magxdesk is seriously underrated IMHO. Anyone else out
there using Magxdesk?

> I guess 90% of them are using Jinnee.

Doubtful: I'd expect more Thing and Ease users, TBH.

> working desktop like one must do with MagiC.

I'd argue that Magxdesk *is* a good working desktop, so you don't have to
buy anything else for MagiC.

Which I suspect is more to do with your perception than reality. Though the MiNT posts are frequently cries for help from Atari people going frantic when presented with a whole bunch of Unix stuff... :->

> Yet, the thing about magic is that half of these users got a
> cracked/pirated/hacked version of magic. So at least they can try, and of

I resent this. Especially when it's mentioned in another message in this thread that a large proportion of the N.AES users outside Germany have ripped it off. At best this is a case of pot-kettle-black.

I have BOUGHT MagiC twice (once for my STE, once for my PC), and I am not alone in having paid good money for it. You may not like MagiC, but there are plenty of people who like it enough to pay for it.

> People; if you have magic and using it, ask yourself this question again:
> "Should I register it, is magic really worth it?" I can tell you right now

I did. Twice. It's great. It has a UK distributor, it's easy to buy. Unlike N.AES for example.

> For people consciensous/honest enough, they then might consider MiNT
> kernel with NO aes, or the free OLD/buggy multitos.

No such thing as free MultiTOS: it was commercial. AES 4.1 would have been commercial if it had been finished and released, but it wasn't.

> Few of you all have the balls to admit some of the "hidden" things, which
> totally changes the scope of such a thread.

Such as your accusation that half the MagiC users are using pirated copies? I, for one, am not. Followed by your suggestion for a "free" MiNT GUI, which is to use a ripped-off commercial AES? Hmmm...

> There is a lot to say about this subject, it has started YEARS ago, and
> still keeps on as of today, I like talking about this topic as it is

> rather interesting, business/development/marketing wise. Some people might
> get annoyed by such a newsgroup thread.

Only when reality gets submerged in MiNT-paranoia.

For the benefit of anyone who thinks I'm planted firmly on the MagiC side of this particular fence (the regulars here, including Katherine, will already know my views), I actually think highly of MiNT. It's particularly well-suited to some applications and very flexible/versatile, largely due to the unix stuff. I prefer MagiC for general use. I don't particularly like the blinkered attitude of some MiNT evangelists who seem to think MagiC is the spawn of the devil. Similarly MagiC evangelists who think the same about MiNT.

This is a typical MiNTy attitude: they call ASH and MagiC for not sticking to "standards", yet rumour has it that any time the MagiC people have tried to work with the MiNT people on this they just get abuse. The word clique springs to mind. Certainly there is a rather sniffy attitude of "we write free software therefore we're better". Yawn.

> > I believe we are just 2 type of person within atari community. The atari
> > ones (atari corp) and the magicmac, flashy twingies GUI ones.

This is just propaganda. Atari only licensed MiNT so they could rush out a multitasking OS quickly as half the work was done. MultiTOS in its release form has no more functionality than MagiC (less, TBH): if you want all the unix stuff you're on your own. Atari weren't interested in the finer points of MiNT, they just used it to produce a simple multitasking OS. Pity it was so slow and buggy, but there you are. BTW Atari Corp has been dead and buried for years now. And if flashy GUIs are so bad, how come you're all using N.AES and Thing?

All this "MiNT is the anointed successor to TOS and the one true Atari OS" routine is utter bollocks, TBH. The ST's main attraction was a nice easy to use OS with a GUI, not a whole bunch of Unix bits tacked together (NB the latter can be extremely useful, but that isn't the point here). In that

sense, MagiC is closer to the original spirit, as it were.

It seems the Milan (and maybe the Hades) do not like hardware access to
keyboard. I will have to disable it on machines different from TT and
Falcon. It meens that it will be only a demo if you can not play :-(.

The VDI version should work on Atari Falcon and Atari TT with graphic
card (and Falcon without graphic card in TrueColour mode). Anyone has
tested it (in 15,16,24 bits mode) ?

To be compatible with all Atari with at least a 68030 is on my todo
list, but I do not know when it will be done...

sticking
> to "standards", yet rumour has it that any time the MagiC people have
tried
> to work with the MiNT people on this they just get abuse. The word

"Rumour" is the correct word here, none of the MagiC-developers
participate on the MiNT-list. Also, many of the members on this list
use both MiNT and MagiC, and believe me - MagiC-compatibility *is* an
issue.

The latest N.AES-version is supposed to support the MagiC-specific AES-
objects and I've also heard rumours that it has Wdialog-functionality.

MagiC is also getting more and more MiNT-compatible so obviously this
is not two separate worlds.

> springs to mind. Certainly there is a rather sniffy attitude of "we
write
> free software therefore we're better". Yawn.

The Slashdot-syndrome? I haven't seen any of that (yet), but it might
happen...

> buried for years now. And if flashy GUIs are so bad, how come you're
all
> using N.AES and Thing?

Kellis actually has a point here... I'm not saying that flashy stuff
are bad in itself, but very often it compromises stability and
functionality ("Active Desktop" anyone?).

One of the things I noticed when I ported Taskbar to MagiC (OK, it
will be released someday, I'm just a bit tired of this project right
now) was that all the new MagiC-users requested things like icons,
titlebars, bitmapped buttons etc., something that never was an issue
when it was N.AES-only. Ofcourse, I implemented some of these things as
I like it flashy myself ;-) It eats memory and slows down redraws
though.

> All this "MiNT is the anointed successor to TOS and the one true
Atari OS"
> routine is utter bollocks, TBH. The ST's main attraction was a nice
easy to
> use OS with a GUI, not a whole bunch of Unix bits tacked together (NB

This is not the point either, but the fact is that Atari set a new standard when they released MultiTOS, especially in the AES. There's no question that MagiC violates this standard in many aspects (like the size of 3D-objects), unlike other AESes like Geneva, N.AES and oAESis. This is unfortunate, but not fatal as all problems can be avoided with properly implemented applications.

> latter can be extremely useful, but that isn't the point here). In
that
> sense, MagiC is closer to the original spirit, as it were.

Both true and false. This is true if you look at how most people use MagiC and MiNT/N.AES. Most MagiC-users are 100% GUI-oriented with a lot of flashy stuff on their disks, while most MiNT/N.AES-users tends to like unix-shells and -stuff. But there's no problem in using MiNT/N.AES as a pure GUI-environment, in fact I know people who has simple MiNT/N.AES-setups with only [V]FAT-partitions and no unix-stuff (or MiNT-Net) at all, but with all the GUI-goodies most MagiC-users like. And vice versa, I know MagiC-users (only two, but...) who use Mupfel and runs a lot of GNU-stuff.

Hm, I mailed Axel Gehringer about some ethernetcards yesterday, and I
got a reply just a few minutes ago.

Btw. he has some BioData, PAMs and Riebl ethernetcards in stock, but
they're terribly expensive (179 EUR). I know they're hard to find, but
honestly, I'm not *that* desperate for a ethernet-card...

>know how to wire it up properly. This is what I was asking about when
>I ask for info on how to wire it up correctly.

That's a little severe for me! Personally I would try and get another
cable and experiment with that before that then allows you to refit the
original cable when needed.

>
>The other way would be to put the Falcons stock keyboard into the
>Mega ST keyboard case if it will fit and to lengthen the wires one
>at a time on the keyboard to motherboard connection plug.
>This is the way I'd prefer doing it.

>I lengthen the wires. I have a CT2 v.B Falcon if that makes any

>difference about possible keyboard signal loss.
>

The wire on the Mega's keyboard are longer than those on the ST or
Falcon so you shouldn't have too much of a problem as they aren't as
sensitive as SCSI... are.

>I'd like to have at least 3 feet of sometype of keyboard cable.
>So that I can use the keyboard away from the light house tower case.
>

That's the distance I have with my Tower & Desktopper and I've not
experienced any problems.

>When replacement keyboards are used with recased Ataris, especially
>Falcons, What kind of keyboard cable is used and how long are these
>cables?
>

As I mentioned above, I thought the external; keyboard casing came as
standard! I find it pointless putting the motherboard in a case if you
can't use the keyboard!

That figures! I did come across an STE that couldn't use the 2nd memory
banks for upgrading. According to, I can't remember his name now!!!!,
this chap that does/did Atari repairs etc. in Hucknall, Atari did some
prototype motherboard and released them before thoroughly checking them
out.

If anyone reading this has one of these machines, I do have an upgrade
board that will upgrade you to 4 meg.

Actually, they all suck if you're not used to read technical documents... Take a look at http://www2.gol.com/users/oskelton/mint.html, a MiNT-newbies attempt to install and configure MiNT/MultiTOS.

(Please note that the author's assumption that STiNG is not MiNT-compatible is wrong. STiNG works fine with MiNT, but not with the AES 4.1-beta from Atari. With any other AES there's no problem with STiNG.)

> and can I find a distribution that has an installer?

MultiTOS? ;-) Now that's an idea, take the original MultiTOS-distribution, replace the kernel and AES and you'll have a pretty good newbie-distribution. It comes with an installer and everything.

Btw. my copy of AES 4.1 seems to be corrupt, it crashes with a bus-error whenever I try to launch applications. Does anybody know where I can find a binary that definitely works?

> > You're not quite up-to-date, are you? I have used MagiC since 4.00,

Only HD here, and I remember that it was a real pain to install it on my STE back in '95 since I had to split it into two disks. A common problem with all ASH-software btw., but I really don't expect DD-support these days.

> Thats good. I'm happy with LZH due to its speed and GEM shell...

I like it too, but the shell is getting outdated now. E.g. it doesn't work properly with high/truecolour-modes.

Really?? Take a look at their pricing-policy, which favours MagiC-users.

> belief of the MiNT community that they will grow into another M$?

They can never do that, since the market for commercial Atari-software
is declining. They do their best though ;-)

For faster service, Please direct all replies through E-Mail to Ben at: atari@benjamin.net or bensmith@teleport.com instead of NewsGroups as I find it hard to keep up with NewsGroups.

I've added more and will be adding more Hardware, Software, Books and Accessories for Classic 8 Bit and Atari ST. So checkout what's new on my WebSite. In Fact check it regularly as my Catalogs are updated regularly. I have 6 different Catalogs, and my SoftWare Catalogs are my largest. They have the biggest Byte Count. And remember if you can't come see me today, come see me tomorrow!

also, if you live in Portland, Oregon, interested in Atari and want to meet with other Atarians. Read the Ad near the bottom of this message.

Click for WebSite!

FREE Catalogs for Classic Atari 8 Bit & Atari ST Computers! Hard-Ware, SoftWare, Books & Accessories! View Atari Catalogs on the Web at http://www.atari.benjamin.net And Jump to my FTP site linked to my Web Site so you can Download Free Catalogs or FTP directly to my site at: ftp.teleport.com/vendors/bensmith/ If you can't get Catalogs that way, Feel free to Request catalogs through E-Mail. Really, it's not an inconvenience. I do ask that you specify Atari 8 Bit, Atari ST or Both! Then I'll send them to you by E-Mail Only. Not Snail (Postal) Mail. Please let me know if I can attach text files to your E-Mail. Catalogs are just regular ASCII text files so you can download them into your text editor and view them, edit them or print them out! It would make things easier for me if you take my Catalogs, load them into your text editor, delete what you don't want and E-Mail me the rest! To expedite things, include your complete Mailing address so I can figure your Shipping/Postage & Handling. I'll be back after the weekend.

If you have an Atari and live in Portland, Oregon. U.S.A. or vicinity, you are cordially invited to attend a Meeting of the Portland Atari Club. You don't have to be a member to attend. We meet the 2nd Tuesday of each Month. Our Next meeting will be Tuesday, October 12th, 7 pm at the Pizza Baron at 2604 S.E 122nd Avenue in Portland, Oregon. Get together with other Atarians. Make friends, meet new people, maybe find an old friend. Eat Pizza, drink Pop & Beer in a decorative atmosphere. Bring your family to a family friendly place. For more info try:

To butt in, I run GEMGS on my Falcon. The only PDF I haven't got to decode/display (full colour)/print is the german DALayoutTC Manual and that is faulty as reported by Adobe Acrobat. If you like I will send you my complete package, bearing in mind you have to set paths and you may have to set the envir. variable.

Bob King.

But it could be a lot of work for a programmer to organize different distributors for his/her program. A global distributor which makes deals with local distributors saves therefore a lot of work. I certainly don't want to sign 6 different papers with 6 different distributors.

Ok, back to the topic: Maybe the n.AES programmer is not aware of the problems people have with Woller outside Germany? I guess he has an email address so you should write to him.

At least I wasn't (with HPP) until I got an email from a customer.

436. The Oasis Mystery

Newsgroup: comp.sys.atari.st
Date: 1999-10-08 00:00:00 UTC
From: phantomm@kih.net
Message-ID: <7tkcmj$7m73@news.ajou.ac.kr>
Source record: 72483

Some of you may remember using Oasis with PPP to finally get our
Ataris on the Net.

The first and last version I used was version 1.35E.

Now I remember that there were some Folks that were Beta Testing
Oasis 2.05 maybe even 2.10. And I did get some e-mail from a
few Beta Testers here in the US that said it was working well.

If there are any folks out there that were Beta Testing Oasis,
let us know about how it worked and etc.

For some reason the development of Oasis has stopped afaik.

What I'd really like to know is if any versions of Oasis after
version 1.35E worked with PPP?

I've tried to set up version 2.05 and never had any luck.
But it sure did look nice. I've seen nothing so far that has
the look and feel of Oasis. Even though we have some decent
Net software now.

I've seen that NOS has been updated?? Isn't NOS part of
the ole Oasis package?

Maybe someone can bring me uptodate on some of this.
I'd really like to get Oasis up and running again even if its
the ole 1.35E version. Can this updated NOS be used with v.1.35E?

Is there any way one could use STinG with any of the later versions
of Oasis to get a working Oasis PPP setup?

And if the programmer(s) of Oasis never intend to start working on
the Atari version again, Maybe someone should pick it up where
they left off. I'd really like to see it come about as it looked
like alot of work went into making it.

Any Info on this is much appreciated.

Hi

I would like to add a high density external floppy drive to a TT (the internal drive is High Density, can I replace the double sided drive in its external case with a PC high density one, or does it have to be of a special kind, do I need to make any changes to the TT? Any advice would be greatly appreciated.

Many thanks

Paul

>
Why from the MagiC world? Both "borrowed" the look & feel from the Mac (look at MagiC6 - I first thought it was a mac emulator ;-)). But at least you'll be right at one point: n.AES is going to support MagiC's extended objects - but that's only important for programmers.

I like both systems a lot and have nAES 1.2 and MagiC6 on my HD. I had however some problems with the free GUIs.

Greetings,
Matt.

I replaced the DSDD drive in a Golden Image external drive with a high-density drive. The original DDDS drive and replacement high-density drives were both Teac drives. I've used this drive on a Mega Ste and now on a TT. It's been working great for several years.

>This won't work on my Milan :-)

Actually, it most likely does (I can't see why it shouldn't). The VDI
version I have of v0.13 works just fine in the normal Falcon 8 bit
(funny picture due to the lack of c2p) and 16 bit modes.

The game probably just never gets that far on your machine...

>The Program proceeds as far as "HU_init: Setting up heads up display", and then
>the entire machine hangs. I have to push the reset button, nothing else will
>work :-(

I've heard about this via email and my guess is that the problem is the
interrupt routines that (I suppose) are still used for the keyboard etc.

If that is indeed the case it should be possible to write things in a
more 'friendly' way. Perhaps even using the VDI/AES.
I'm going to take a look at it.

I did it recently. It's quite easy if you have some basic tools.

> big difference? How did you sort out the power supply? etc. et. What

I did it because I wanted everything (two harddrives, CD-recorder, TT) in
one case. I used an ATX miditower, and the conversion was actually quite
straightforward. The PSU was a bit problematic though, but when I found
the *correct* pinouts I converted it in less than 30 minutes.

If you're interested in details, please mail me.

I 'm trying winSTone..... is a good emulators,

but I read that is possible run on modern PC, ST emulators,
that run very fast, and its has a fantastic graphics (for the Atari ST
family)
as 640x400 with 16 colours or more.

With WinSTon I use my PC as I normal ST and don't as a ST very fast, with
powerful graphics.

Help me.

Have you checked out SpareMiNT? It doesn't bootstrap (yet), but it use rpm
(RedHat package manager) so it's very easy to install/remove packages.
http://sparemint.atari.org IIRC.

> universal either, perhaps a minimal floppy distribution could be set up
> for standard STs ? Postal P.D. libraries never seem to cover this sort of

Right now I'm putting together a "MiNT for newbies" distribution, which
contains the latest kernel, the last AES from Atari (pretty good for a
freebie) and some tools. It use GEM-Setup so it should be quite easy to
install.

Hi Gang!

Months of being unconnected meant I've had to wade through hundreds of articles to catch up with you. Very interesting and educative, too.

However, I've acquired a Hades 060 with the RagePro card, but am having great difficulties. It worked fine at first, but now will not boot up properly: I can only get the TT mono hi-rez. I've got System Solutions racking their brains for a solution, to no effect yet.

Meanwhile, I'm using this old TT (repaired and re-geared!). I would love to read other Hades-users' ideas and solutions, if any.

Thanks in advance,
Charles.

>will help.
>

Hi

Sorry it took so long to answer but I was hoping that someone with more
expierence would answer. It sounds to me like a HD failure have you tried
booting from floppy? My first step would be to boot from a floppy with your HD
drivers on it this should tell you if the HD is useable. If the HD is dead you
will need a SCSI HD 1" high with parity disabled (or you will need to make a
parity generator), and ID #0. If you require detailed instructions on
dismantling the STacy I can provide them for my "keyhole" method, others can
provide you with another method.

If it is not the HD the battery is mounted on the motherboard just behind the
cartridge port. You will need to dismantle the machine and have a soldering
iron handy to replace it. As for how to reset everything I am afraid that I
can't help there as I have not needed to do it yet.

Hope that this helps.

Source record: 72249

Hallo Jeff,

JA>Upon reading some FAQs and web pages, I came to the conclusion that
JA>this is a TT RAM board. Am I Correct?
in my TT, the RAM beneath the hard disc is ST-RAM. The TT is to be found "more left", between the floppy drive and the AC/DC unit. But as my TT has a different revision (no daughter board, no metal cage, just painted red inside), you may be right.

JA>Now, when I boot the system, it reports having 4 meg ST RAM but no TT
JA>RAM.
But that seems to prove my suspicion right.

JA>Is the computer not detecting the daughterboard or something? I
JA>apologize for my lack of experience (this is my first high-end Atari).
I think, your TT is all right. It may run without any TT RAM, but with no TT RAM it won't.

If I'm not wrong, all TTs came with 2 MB ST RAM on board, and there are extension cards with 2 or 8 megs, which gives 4 (your case, I think) or 10 megs.

I can recommend this. I use it at work (on a 500MHz P3 with 192Mb RAM) to
run QED and LZH-Shell, and it's really, really fast. According to
GEM-bench it's 70 (!) times faster than my TT, although I doubt that it
is very fast and quite compatible.

Hi,
The keys aren't different in any way if they're for the same version of Cubase, so don't worry.
Getting a Midex? Good thing you have the original program with the cartridge then - I haven't seen a single cracked version that worked with the Midex...
Seems like you won't have to pay very much for your upgrade, since you're getting a dongle as well - lucky you :) You just have to find someone who has the original 3.x disk, so you can copy it.

Best regards,
Claes

Yep! Its fine for what I need in a desktop. I also reckon no other desktop
comes near it for frugal memory use. On my 14MB Falcon I would run at
800*592*256 colour, with a full screen X-IMG backdrop, NVDI with about
400kB font cache, Cachennn with another 350kB, and still have more than
10MB free RAM...

It works fine, its uncomplicated, fast, and memory shy. What else do we
really need in a desktop? I certainly like it!

I'll take a peek...thanks for the address. It -HAS- to be better
than the documentation I've seen in the distributions thus far!

> > and can I find a distribution that has an installer?
>
> MultiTOS? ;-) Now that's an idea, take the original MultiTOS-
> distribution, replace the kernel and AES and you'll have a pretty good
> newbie-distribution. It comes with an installer and everything.

It came with my Falcon and I still think its horrible. Replacing
parts of it isn't what I'm seeking. I'm looking for an archive
that contains an 'INSTALL.PRG' and 'EVERYTHING.ZIP' type layout.
All I want to do is run 'INSTALL.PRG' and let it do the rest. Is
it some kind of difficulty to write such a program? It could be
an idea for the author of N.aes to provide EVERYTHING in this
way. That way purchasers of N.aes don't have to hunt around the
internet to find everything else...

> Btw. my copy of AES 4.1 seems to be corrupt, it crashes with a bus-

We'll MagiC -IS- their product. They have the right to do that and its
not uncommon. Just look at shareware, register and receive this cheaper
and these free...same principle!

> > belief of the MiNT community that they will grow into another M$?
>
> They can never do that, since the market for commercial Atari-software
> is declining. They do their best though ;-)

We ALL do our best. I work niteshifts to get more money. Its in human
nature to do that because general society decrees we MUST seek more
money to provide for ourselves and our families. If the Atari market
dies a death then they'll have to make a living doing something else.
Just like you and I if our employers went belly up...its not like
they are ripping the Atari world off, because many people are happy
with their product...

Kind regards,

Chris Wilkinson, Christchurch, New Zealand.

Right, but he as for the internal speaker.
Itï¿½s a mixture of right and left audio, same what you got on external
rcaï¿½s

Patrice, I just tested pmdoom 0.15 on my Hades 060, and it worked flawlessly! So, the Hades doesn't have any problems with the kbd hw accesses, it seems :) That said, I'm using the PMMU, have the RAM split into ST and TT ram, and remapped the "ST-I/O" up to where the Hades have its hardware addresses. This could be why it works for me, but I don't know.

I haven't tested it in any TC/HC mode yet, but it sure works in 256 color mode on my ET6000 :)

Patrice, thank you for your GREAT work on this!

Regards..

You can find it on the Belgian ftp-server
ftp://chapelie.rma.ac.be/atari/mint/kernel/freemint-1.15.1-bin.lzh

This is AFAIK the latest official release.
The latest beta version is there also but be aware its a betaversion and
comes without any docs. You better start with he latest offical release.

ftp://chapelie.rma.ac.be/atari/mint/kernel/betaversion/1.15.3b/freemint-1.15.3b-bin.lzh

478. Run an ST without a monitor?

Newsgroup: comp.sys.atari.st
Date: 1999-10-09 00:00:00 UTC
From: helbo@bigfoot.com
Message-ID: <380407c7.8124030@news.cybercity.dk>
Source record: 72364

Many years ago (1986) my very first computer was an Atari 260ST. Later it was replaced by a Mega ST1. But for the last 4-5 years, it has only been standing in the garage.

Recently I got an A/D-converter-card for the serial interface from Conrad Electronics in Germany. Now I got the idea that the old Mega ST1 could be the ideal computer for this card, e.g. as the center in an alarm-system.

The advantages of the ST are obvious, it has a very stable ROM-based OS, it has enough RAM, it has no (power-consuming) harddisk and the applications could be made with the GFA basic-compiler and started from the Auto-folder.

So everything looks perfect. Only problem is that I would of course like to turn off the monitor, in fact I would like to remove both monitor, keyboard and mouse.

As I said I have not done anything on the Atari for the last 4-5 years, so it is pretty remote in my memory. Can anybody recall a solution that would allow me to turn off or remove the monitor.

On 7 Oct 1999 22:33:17 G, Phantomm wrote:

>Interesting, Never knew there was a keyboard layout difference between
>US and UK keyboards. Learn something new everyday. :)

I became aware of this that I noticed that both my first Atari machine
(a 520STFM) and later myt Mega ST came with British keyboards, while in
their user-manual pamphlets there were pictures of machines with
VT100-looking american keyboards.

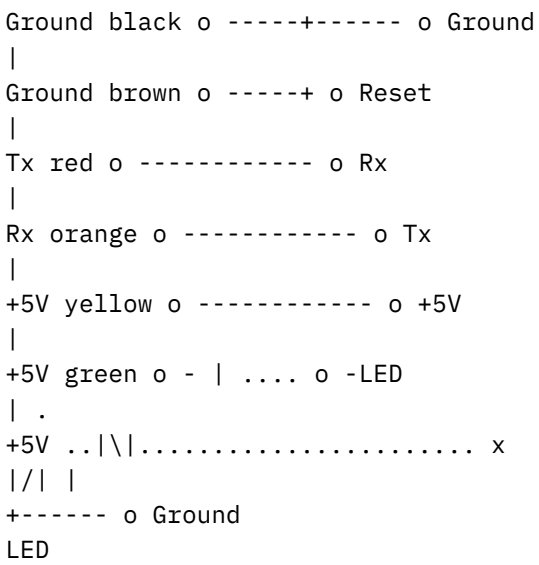
>I do not want to remove anything from the Mega ST computer case.
>I still want to be able to use it. I have a extra Mega ST keyboard.
>However I do need to use the Mega ST keyboard case
>with either the stock Mega ST keyboard or with the Falcons
>stock keyboard placed into the Mega ST keyboard case.
>Whichever would be easier to connect to the recased Falcon.

In my opinion Mega ST keyboard is of a superior quality when compared
to Falcon or the plain ST keyboard. And apparently i is possible to
use such keyboard with a Falcon. This is an extract of something that
I found among some documents on my HD:

Mega ST /TT keyboard Falcon

*

*



I do not have a Falcon and I have not tried this, so you are doing this on
your own risk. A confusing detail about ths modification is that I have

two documents concerning it, and in one the Falcon connector has 10 pins,
while in another ithas 8 pins. Two debatable pins are marked as * above.
As far as I could understand, the LED line is just an option.

Oh, and I seem to remember that I have read somewhere that a Falcon with
an external keyboard like this needs a manual reset after power on.

>My first thought was to cut off the Telephone type keyboard plug
>from the end of the Mega ST keyboard cable. And then replace that plug
>with the keyboard to motherboard connector from the Falcon.
>...
>I'd like to have at least 3 feet of sometype of keyboard cable.
>So that I can use the keyboard away from the light house tower case.
>
>When replacement keyboards are used with recased Ataris, especially
>Falcons, What kind of keyboard cable is used and how long are these
>cables?
>
>Do I need to worry about signal loss due to the keyboard cable being
>too long?

Do not cut anything, it would be a pity. Buy a short (1-1.5m) piece of
telephone extension cable (four or six wires!!!!!) together with UTP
connector(s). I have been using a 1m extension for a couple of years
without any problems. Use a male connector towards the keyboard if you
want to replace the original keyboard kable, or use a female connecor
if you want to extend the original Mega ST keyboard kable. Maybe you
can install a female connector on the new Falcon case so that
everything looks nice.

The common telephone connectors with four contacts will do (they
correspond to middle four contacts of a six-contacts connector),
because, as you can see above, the Ground and +5V lines are doubled.

Cu.

Hi all,

Found a nice sample conversion program on funet called Samplec,
by Richard Evans.
It can do a few things which 525 can't so I decided to register.
Unfortunately the email address in the register.txt file is the address
of the company where Richard used to work, but not anymore.
I think he has probably left the Atari scene.
Unlikely, but, does anybody perhaps know how to contact this guy?

Regards,
Guido

Many thanks folks, I opened my TT again last night and tried it out. The
jumper is there, but the little piezo-screamer in the ATX-tower didn't
work. It's not a big problem though.

The "Ultimate Virus Killer 2000" is the industry standard virus killer for the Atari ST/TT/Falcon platform. The program has been around for well over a decade, and with the latest release (8.1) it's turned shareware.
There is now an official "UVK 2000" support site where you can download the program, find descriptions of all Atari TOS-platform computer viruses (and their symptoms) and more. It's located at http://www.fortysecond.net/uvk.
This message is being sent to three newsgroups. If you think this constitutes spam, or if you think this message does not belong in your particular newsgroup, please contact me at cronos@atari.org and I will refrain from posting to the newgroup in the future.
Thanks for your time.

485. ST News International Christmas Coding Convention 2000 Site Overhauled! (Atari scene-related)

Newsgroup: comp.sys.atari.st

Source record: 72371
Cross-posted to: alt.demogroups,alt.anybody,alt.www.sites,comp.sys.atari.st,alt.crews.atari

Are you a member of the former Atari 'scene'? Did you, perchance, visit the "ST News International Christmas Coding Convention", in Oss, Netherlands, December 1990?

Then you should not wait a second longer and surf over to http://stniccc2000.atari.org to discover that, in fact, a reunion of that very historical event is being organised for December 2000, a 10th anniversary reunion as it were! It is going to be the coolest event of the millenium, I can assure you!
In case you've already surfed over to that site in the past year or so, be advised to check it out again, as it's been overhauled utterly! It looks way cooler now, and contains a lot more information!

> tried Thing (and especially jinnee) you'll find that you have a much more
integrated
> system.

The only time this was a problem for me was that drag and drop didn't work
in one direction with AFTP. Didn't seem worth buying a replacement desktop
and probably using more RAM (precious resource on STE) just to get that to
work, as it was non-critical. Might be worth experimenting a little with
MPC, I guess. I tried Thing (early version) with MiNT, and it was quite nice
(esp. compared to Newdesk), but I never felt the need to change from
Magxdesk on my main setup.

What other programs/utils would an upgraded AVServer affect?

...which MultiTOS does... What exactly are you looking for? I tested it just now, and replaced AESSYS and the kernel with the latest versions. I then installed it on my TT (by simply starting "setup.prg") and everything went smoothly. Rebooted and booted straight into MultiTOS. With NVDI it's actually quite fast, not as fast as N.AES but much, much faster than the original MultiTOS. It's stable too.

Now I'm going to take a look at GEM-Setup, and if possible write a small program that sets up mint.cnf and gem.cnf. You'd then have a distribution that installs something similar to MagiC (multitasking kernel and AES, some tools, VFAT etc.), but ofcourse with a pretty crappy desktop.

> All I want to do is run 'INSTALL.PRG' and let it do the rest. Is
> it some kind of difficulty to write such a program? It could be
> an idea for the author of N.aes to provide EVERYTHING in this

What do you mean by "everything"? A 200Mb+ distribution? You already get 4-500Mb worth of MiNT-stuff if you buy the CD-version of N.AES. Current versions doesn't have a install-program (you have to copy two disks to your boot-partition, not particularly hard...), but 2.0 will use GEM-Setup and have GEM-based tools to configure mint.cnf and n_aes.cnf.

|solution that would allow me to turn off or remove the monitor.
```

The only restriction that I know of is that the computer reboots if you disconnect a ST High monitor. This is to prevent damage to other monitors from the frequencies used. There is a hardware device to detect this. Therefore either boot with a Medium/Low monitor or don't use any (i.e. use a self booting program from floppy).

Its function key 11 or 12, either by itself or with shift or alt
(sorry the peecee is at work). This shows the Gemulator screen and
you can click on Exit in the top left corner.

Hi Bob,

That would be great, it may save me a lot of time and hair pulling.
I assume it is quite a lot of data so it may be better to compress
it in chunks with ZIP or LZH.

No great hurry.

Patent Office eh. Sounds interesting.

The latest version can be found on the homepage of Booklage:
http://obooklage.free.fr/INDEX.htm

Furthermore you can find this OVL (not always the latest but I'm doing my
best to upload a new version asap) on the Belgian ftp-server

ftp://193.190.204.128/atari/internet/cabovl/cab-booklage_ovl-558.lzh

BTW,
>the page should work fine with Adamas except the whole stylesheet thing.

Now that you mention Adamas, I download the 1.6 Pro demo. While the SetupWizard
is a breezze to use, no problems at all, it seems that I can`t get Adamas to work
online.
I do get a connection, works very well actually,- but Adamas refuse to
download anything from the web.

Is this a normal behavior or am I doing something wrong here?
BTW, Adamas have some problems with frames when I test it offline, and no
option to resize the window. And it didn`t handle the fonts very well.
Not on my setup anyway.

>MiNT.

Agreed. I *do* manage to get the odd bit of coding done, and I even know my way around UNIX to some extent. It's just that all I need to complete my PhD right know are LaTex, UDO, Graph, Imagecopy and my FORTRAN compiler. All of these will run together and be stable under Magic. Tinkering with various O.S.es can be fun, but it's time consuming. In the meantime, I have a couple of points to add.

1) -There's nothing wrong with N.AES being commercial, commercial software can be included in the GNU public license, but it certainly isn't /free/ in that context. Perhaps it does rather jar with the "philosophy" of MiNT ? (Free in terms of rights, not in terms of not having to pay for it.) I used to play with Xaaes, I take it that's dead now ? Roll on oAESis.

2) Things like Debian, Redhat and Slackware Linux are available on C.D.s with installer programs for less than 5 U.K.P. Theres nothing wrong with ease of installation. KGMD and KEMD were great, but aren't they a little long in the tooth by now ? What's needed is a new distribution with the latest kernal, GCC and other GNU tools and X11. -Bolt on the latest stable free AES just in case. Perhaps people could band together and distribute a MiNT CD with install scripts on a for-little-profit basis ? It might be the best way to build a bigger user base. Downloading those huge, ageing distributions will deter many .net users, let alone the vast numbers of Atarians who aren't even online. CD rom drives aren't universal either, perhaps a minimal floppy distribution could be set up for standard STs ? Postal P.D. libraries never seem to cover this sort of thing.

Have Fun,
"Augeas"

Hi Joergen

I can't get frames to work on Adamas here either but rezising is just
a matter configuring. If you click on "change settings" and then the
browser tab, there's an option called "standard sizing" if I remeber
correctly. Just tick it and the window is resizable.

I used Oasis 1.35E on my Falcon. After getting it configured and set
up correctly, I never had any problems with it.
Never had any crashes or problems. The only thing I had to watch out
for was Fragmentation. Oasis 1.35E did tend to Fragment alot, and as
long as I used Diamond Edge once a week or so to keep Oasis cleaned up
I had no problems at all.
Plus Oasis 1.35E has lots of commands for controlling how things
work. Telnet is a nice benefit too.

>> And if the programmer(s) of Oasis never intend to start working on

I just hate to see software with good possibilities go to waste.

>Hope I haven't dashed your enthusiasm too much!

No, not at all. :)

I do want to say thanks for all the information everyone has posted
about Oasis. It has been very helpful. I do intend to try all the
other software that has been suggested. Newsie has worked very well
for me, but I do want to explore other Net/Web software for the
Ataris.

Thanks,
phantomm@kih.net

I'll just lengthen the Falcons keyboard connection cables. That way
there is no guess work. And I won't have to destroy a good Mega ST
keyboard cable.

>The wire on the Mega's keyboard are longer than those on the ST or
>Falcon so you shouldn't have too much of a problem as they aren't as
>sensitive as SCSI... are.

I read somewhere about possible problems with keyboard signals on
Falcons that have upgrades in them when you extend the keyboard
cable. Hopefully this isn't a problem.

>
>As I mentioned above, I thought the external; keyboard casing came as
>standard! I find it pointless putting the motherboard in a case if you
>can't use the keyboard!
>

Maybe it does if you buy a new case. This one happens to be a used
one. Did not get a keyboard case with it. I stated that I needed to
use the Mega ST keyboard case, as that is the only keyboard case I have

to use. Actually its probably a better keyboard case to use.
I can paint it black to match the Tower and put the grey keyed Falcon keyboard in it. It will look smart when I'm finished.

I cannot find a new case here in the USA. Unless its a Wizztronics case or a PC type case.

Why do you think I can't use the keyboard? I can use any keyboard I have here with it except for the 8-bit ones. It just that I like to customise my Atari stuff and I'm trying to find the best way to connect the keyboard that will fit my needs.

Hi Folks,

A few questions about CD Recorder.

My manual is in German so there are a few things I'd like to
get cleared up.

When using CD Copy after doing a Scan, what is MCN and ISRC
really for?

Also, When using CD Copy to copy a CD. Can you copy the CD
from a SCSI CD Rom drive directly to a SCSI CD Burner if you have
both drives on your system?

Or do you have to copy the CD to a hard drive partition then
copy the data on the hard drive partition to the CD Burner?

And can CD Copy be used to copy any type of CD including
Data CDs?

Any help is much appreciated,
phantomm@kih.net

Keyboard must be connected, but you can lock it with an kew switch.
If you remove the monitor while the machine is running resets the
machine, build an interface that switch the monitor on if you got an
alarm. Otherways itï¿½s off. Donï¿½t forget the service switch :)
I donï¿½t know if you like that, its my idea for your problem.

Regards, Robert

You can check the screamer :) with a simple 1.5V batterie.
Otherways, 2-3 Transistors and other part must be checked on tt
mainboard. Sure, i also moved this bloody thing away from my falcon.
Some external speakers are much better.

the magic people is I would imagine the author.
The magic src are not available (which is understandable), and the MiNT
are totally free to be used, checked, read. What do you really expect?
The MiNT development team decompiling magic os? for what? when The Magic
author just to stick with the rules only has to read the MiNT kernel src.
Magic people have tried to work with the MiNT people, I don't know, I
don't think anyone can say that, nor the opposite.

> enough of it on and off for me to start believing it, especially when I see
> just how fanatical *some* MiNT people get, eg all that hubbub about Atari
> Computing being in league with the wicked ASH because most of the screen
> shots were taken from MagiC. Pu-lease...
fanatical, i guess that is why in 3 months to be in the year 2000 we are
still using atari as main computers, checking atari newsgroup, downloading
software, writing software etc all for atari, I guess yes, it requires
some fanatism. People get proud of what they accomplish, I am really proud
of the amazing effort some people have done, (Frank, Guido, Thomas,
Michael etc). It seems, everytime I see something pushing Magic as being
the leader, the best, the ONLY OS for atari, That really is a slap in the
face for many people. That concerns me. When I see that MiNTnet can't do
PPP, OLGA Magic only, bubbleGEM Magic only application, NVDI5 etc etc.
WHich makes non-sense, this gets advertized, is wrong information, and all
that to promote an OS (which in my opinion is quite weak, unreliable).
Yes, this does bothers me.
I guess that's what comes with being fanatic. Aren't we all fanatic here?
Am I in the right newsgroup?

> > > springs to mind. Certainly there is a rather sniffy attitude of "we
> > write
> > > free software therefore we're better". Yawn.
This is the typical defense someone would take when no valid points can be
brought up.
I am not sure of what you are talking about here. Software is not
better coz it is free, It is better coz it is just better!, higher
quality, more flexible, open standard, open src so at least you can
what's wrong, just better. Now if price comes into play, well that is not
even fair anymore :)

> > > buried for years now. And if flashy GUIs are so bad, how come you're
> > all
> > > using N.AES and Thing?
Who said it was bad to have flashy GUI? It is only a matter of importance,
priorities.
I thought this was quite clear in people minds, obviously it is not. Lemme
explain how I see this:

You have a time frame with 2 development projects.
One project would spend 80% on an easy install, flashy cute GUI, icons
everywhere etc. So people can use the software.
20% is left for the core of the software itself. Which in my opinion:
It would make MUCH more sense to spend 80% of the development on the core
itself, then when stable, fast, reliable etc, THEN work on the easy
install extra programs.
Why having a SUPER install for a lame software?
Installing software, AS trivial as it may sound, is STILL a piece of cake
as opposed to write the memory management at the kernel level, or
rewriting some Filesystem, etc. Don't you agree?
I would have some long nights trying to install a software, why not!? Can
you imagine from the develpment side?? Takes months, years to develop.
Am I the only one seeing this? Higher priorities and better management in
the development phases.

> > titlebars, bitmapped buttons etc., something that never was an issue
> > when it was N.AES-only. Ofcourse, I implemented some of these things as
> > I like it flashy myself ;-) It eats memory and slows down redraws
> > though.
Exactly Jo, I love GEM myself, probably why I am still on atari. And my
desktop is quite well featured. But having a dead nice interface with no
background processes is quite ridiculous. Can anyone tell me why is
gemtrade so crappy? Isn't supposed to be THE advanced version of
Ruftrade?

> Precisely. People use the OS that suits their needs, on the whole. Which is
> why the whole OS war thing is largely pointless: both have their strengths
> and weaknesses. Frankly I'm tired of evangelists on both sides (though I
> reckon there are more fanatical MiNTies than fanatical MagiCians). Both OSes
1)Not that i want to sound mean, But probably coz MiNters are probably
feeling oppressed, while magicer are just clueless about anything else,
probably due to misinformation coming from STcomputer, AC-computing,
interviews (and whatever).
2)That we are a special group of atari users, we're connected, and there
MiNT makes much more sense in my opinion, with MiNTnet.

Also another point i wanted to bring out, I read you said (or someone
else) said that if they spent 30 min max on their computer per day it was
a lucky day. Well lemme tell you that in this case, what is the real
need to multitask, of course you wouldn't care about servers, stability of
the kernel, (30 min ain't enough), you probably don't care also about the
memory protection and certain is not even concerned about memory
fragmentation.

In my opinion, your 100 bucks invested in magic was pure loss for your 30 minutes. Singletos would have achieved your needs.
That's what I think.
2 different types of users, 2 different type of OS. Ignoring MiNT is a big mistake, especially as of today with more and more src available, better libs, wider use of the internet in people's home.

> exist, neither is going to go away in the short term.
As far as I know, MagiC could go away tomorrow, and that's it. What do we do with CAB now? just need to live with the bugs? Years of development wasted to nill, money wasted by many users here for a discontinued unsupported software.

> software is written to only work with one system (I'm talking about general
> apps here, not system utilities). If it doesn't work on both these days then
> it's silly. Just as silly as people writing programs deliberately to not
Compatibility should be done at a lower level. Not from each within application. It becomes quite clear that maintaining a software in 4 languages and 2 OS is a big pain. Pure wasted time/energy/enthousiasm, just because the OS didn't want to comply with some standard already established. (now some pelople will say that magic was before MiNT, so MiNT have to follow magic, and that's probably where the war started and still is going on) "war, not in a bad way automatically, rather disagreements"

> work on emulators. This is a small market, why restrict your software to an
> even smaller potential user base unless it really needs some specific
> hardware, eg DSP?
Probably in a way to reunite the users, more focus on some standards by forcing using the hard way as obviously the soft way didn't work. How many of you still don't have an AV-server setup for example?
Thanks.

F11 then a right click with your mouse will bring up the Gemulator
screen.

Gemulator seems to be the smoothest and most realistic emulator I've
tried (and I think I've tried them all). But I have trouble getting it
to read from Drive A properly. Maybe it's my brand of drive? If I copy
programs onto Drive C they work just fine and dandy.

Online documentation says:

[F11] = switch to Windows mouse pointer & desktop
[Ctrl][F11] = Shows Gemulator main dialog (now you can close Gemulator)
[Alt][f11] = Shows Properties dialog
[Ctrl][F12] = reboot Atari
[Alt][F12] = reboot & switch modes
[Shift][F12]= reboot & switch monitor

Cu.

> although heaps of blank page at the bottom does indicate some kind
> of funny formatting issue. I did notice the expected file size was

Such formatting is caused because browser fonts normally appear larger on a PC than they do on the Mac and Atari. The use of larger fonts means the text will fill that void of blank space you see on your Mac. You'll occasionly see this on the Web -- a tell-tale sign of Windows authoring.

I've seen some sites where the fonts are so small I can't read them using defaults on the Atari or Mac, yet on the PC they're more than legible (because they're bigger). All this based on browser defaults with the same screen size (800x600), and consideration given to the fact that CAB doesn't understand the attribute to summon specified fonts (e.g. Arial).

I use exactly the same TrueType browser fonts on the Atari and Mac, but on the PC they're bigger.

You can use the LAN-port as well, but unless you need the serialport for
something else it's not worth it. They're equally fast, but you'll need a
special cable for the LAN-port (RS422<->RS232).

I was referring to O2 concerning the redraws and crashes, though O1 had the
redraws to a lesser extent. Maybe not so noticeable on a Falcon, very
noticeable on an STE.

> Plus Oasis 1.35E has lots of commands for controlling how things
> work.

If you mean the configuration bit of O1, it's a bit hit and miss and
incomplete: half the time I ended up editing startup.nos by hand. Manual
editing won't work for newsgroup selection, though, as O1 alters its own
settings as well as NOS's. As it is a little unpredictable I'd recommend
backing up startup.nos before changing anything else apart from newsgroups.

> Telnet is a nice benefit too.

It's NOS that does the telnet bit, not Oasis (in O1). BTW there is a program
out there somewhere (try the UTSI?) called VT100EMU which changes the
standard Atari console from VT52 to VT100, very useful with NOS's telnet.
Not sure how this is handled in recent NOS versions which are GEMmed, I
believe.

> I just hate to see software with good possibilities go to waste.

Trouble is, possibilities was about as far as O2 got. To be charitable I think the authors bit off more than they could chew: NOS was a hard act to follow with ICE and that was the bit that really was hopeless. The offline reader might have had a future had they stuck to standards instead of ignoring them (eg threading). They did spend a lot of time reinventing the wheel, though, both with ICE and the editor (which is the pits: everyone who valued their sanity used Everest of equivalent alterative editor anyway).

As I said in another post I used the word "rumour" deliberately, as I am going on second-hand references in c.s.a.s to the treatment of MagiC developers (not clear who precisely) in the Maus net (which I don't read, not being a German speaker).

> The magic src are not available (which is understandable), and the MiNT
> are totally free to be used, checked, read. What do you really expect?

The source is not available, the programming docs are. In English, courtesy of Peter West. See sig for location.

> The MiNT development team decompiling magic os? for what? when The Magic
> author just to stick with the rules only has to read the MiNT kernel src.

In other words: MiNT is the real OS, MagiC has to follow our rules. I rest my case.

> Yes, this does bothers me.

The only one of these I recognise is the PPP stuff which was in the CAB manual, which is just plain wrong. If you've read my postings regularly, you'll know I am no great fan of Iconnect and I am not uncritical of ASH, either. However I don't agree with your opinion that MagiC is weak and unreliable.

> I guess that's what comes with being fanatic. Aren't we all fanatic here?

No. I would say most people are enthusiasts, rather than fanatics.

> Am I in the right newsgroup?

That's for you to decide, and you alone. You could always set up alt.magic-os.hate.hate.hate or something if you'd feel more comfy there :-)

> brought up.

Why? It's a valid point. See analysis below.

> I am not sure of what you are talking about here. Software is not
> better coz it is free, It is better coz it is just better!

So far so good. I prefer MagiC for everyday use so for me it's better. You prefer MiNT, so for you it's better.

> higher
> quality, more flexible, open standard, open src so at least you can
> what's wrong, just better.

So as part of your requirements for being better, you include open source, which won't happen with most commercial software, at least not at the moment. In other words "it can't be better, it's not free". QED.

BTW, to reiterate, I don't regard either MagiC or MiNT as intrinsically better. They just suit different people's needs better, one way or the other.

Sorry, you've lost me.

> > > > buried for years now. And if flashy GUIs are so bad, how come you're
> > > all
> > > > using N.AES and Thing?
> Who said it was bad to have flashy GUI?

You. From another of your posts in this thread: "I believe we are just 2 type of person within atari community. The atari ones (atari corp) and the magicmac, flashy twingies GUI ones". In other words, "*real* Atari people aren't bothered by the interface, only frivolous airheads using MagiC, and probably not on *real* Atari hardware either". Oh and this time you forgot to accuse the MagiC users of all being pirates while you were at it...

> It is only a matter of importance,
> priorities.

In which case why the jibes at MagiC users as if all we care about is how it looks?

> rewriting some Filesystem, etc. Don't you agree?

I have no disagreement with you on this at all WRT to using text config files etc, as long as they are well commented and documented. A good commented text config can be a lot quicker to set up and maintain than a bad GUI configuration.

However, like it or not, MiNT is *not* easy to work with for most people simply because you can't work out where anything is or understand the docs half the time unless you have some unix experience. It's so alien to the way

ordinary Atari apps work. It's worse still if you take an easier route and install something like the TAF package where what docs there are have been mostly cut out to save space and you are encouraged to use vi (the editor from hell) to edit the config files. So when your MiNTnet setup stops working (as mine did when my ISP changed its PPP implementation), you haven't the faintest clue where to start even installing a new version of MiNTnet. At which point (in my case) STiK came out and saved the day (note: with text config files), working with MagiC and generally being a darn sight more usable in spite of its limitations.

> I would have some long nights trying to install a software, why not!?

Because I want to *use* the machine rather than spend a lifetime configuring the thing.

> Can
> you imagine from the develpment side?? Takes months, years to develop.
> Am I the only one seeing this? Higher priorities and better management in
> the development phases.

There is no point developing the thing if it is *so* alien to how the standard OS operates that no-one can figure it out. I would posit that most Atari users do not find the unix way of doing things remotely intuitive. How are you supposed to discover that your system is playing up is because file /etc/twiddle/.splodge (which is hidden just to make life harder) hasn't got the right permissions? And what is familiar or "Atari" about executables without .TOS/.APP/.PRG/.TTP extensions, or worse executables which have the extensions but can't run because some flag isn't set? I have no problem with unix conventions per se, but I do find it amazing when this stuff is presented as normal for Atari OSes.

> > Precisely. People use the OS that suits their needs, on the whole. Which

> probably due to misinformation coming from STcomputer, AC-computing,
> interviews (and whatever).

Who is oppressing MiNT people? It's more likely:

1. The things which MiNT users get excited about make no sense at all to anyone not already thoroughly immersed in it - a look at the kind of discussion which takes place in muc.lists.mint is enough to convince the rest of us that MiNTland is located somewhere in the next universe.

2. MiNT isn't readily available in a form which newbies can use. You can't get N.AES outside Germany with any ease, MultiTOS is long gone, so you're left with huge downloads of incomprehensible stuff or trying to locate one

of the CD installations, which assumes you have a CD drive for your Atari. Or you just go and buy MagiC on a couple of floppies, install it and get on with life.

> 2)That we are a special group of atari users, we're connected, and there
> MiNT makes much more sense in my opinion, with MiNTnet.

Why? MiNTnet makes more sense if you are trying to set up a LAN etc, for online use STinG is less trouble and works with TOS (and MagiC, natch).

> Also another point i wanted to bring out, I read you said (or someone
> else) said that if they spent 30 min max on their computer per day it was
> a lucky day.

Someone else. I use mine for hours, though mostly net stuff for which I use the PC these days. Before that I used my STE with MagiC for hours each day.

> Well lemme tell you that in this case, what is the real
> need to multitask, of course you wouldn't care about servers, stability of
> the kernel, (30 min ain't enough), you probably don't care also about the
> memory protection and certain is not even concerned about memory
> fragmentation.

Most of this stuff is largely irrelevant to what people want to do, even online, with the exception of memory fragmentation (which happens under both MiNT and MagiC). See what I mean about MiNT people getting excited about obscure stuff? NB I'm not saying this stuff is per se without value, far from it, just that most people probably couldn't give a hoot about servers being available etc. They just want to get on with doing what they do with their machines. The finer points only really come into play with LAN stuff, using Ataris as web servers, file servers etc. This is not a common pursuit.

> In my opinion, your 100 bucks invested in magic was pure loss for your 30
> minutes. Singletos would have achieved your needs.
> That's what I think.

Fine: not your money, not you making the choice to spend it. Maybe the person made a different choice, to spend the money to have a nice system for the 30 mins a day. Perfecty valid, who are you to say s/he shouldn't buy MagiC if it suits them just because you wouldn't?

> 2 different types of users, 2 different type of OS. Ignoring MiNT is a big
> mistake, especially as of today with more and more src available, better
> libs, wider use of the internet in people's home.

Most people couldn't give a fig about source being available. Most aren't programmers and don't own a compiler: in practical terms, the source is just wasted download time if it's included in the archives. Programming libraries are equally of no use to anyone but programmers. Wider use of the internet doesn't exactly require MiNT, does it? Unless you are interested in intranets, servers, LANs etc etc as stated above.

> > exist, neither is going to go away in the short term.
> As far as I know, MagiC could go away tomorrow, and that's it.

Same with any software. If Andreas Kromke et al stopped development, who is to say it wouldn't be passed on to someone else? No guarantee, but then MiNT went into the development doldrums for a while, didn't it? Who is to say that might not happen again?

> What do we
> do with CAB now? just need to live with the bugs? Years of development
> wasted to nill, money wasted by many users here for a discontinued
> unsupported software.

I disagree. Development and money isn't wasted: we still have a usable browser for our money. I for one am grateful that CAB came along when it did and served me well for the time when it was my primary (in fact, only) browser. I still use it regularly: it hasn't suddenly stopped working just because A. Clauss has moved on to other things. It's a shame it's not being developed any more, but if you bought it you got what you paid for. It would be nice if he passed on development to someone else, but how could he release the code if it is still on sale as a commercial product? And why shouldn't he get the money from selling it after all the work he put into it?

> > software is written to only work with one system (I'm talking about

> still is going on) "war, not in a bad way automatically, rather
> disagreements"

My understanding is that cleanly-written software will generally run on either MagiC or MiNT (or TOS if it doesn't *require* multitasking). However I'm not a programmer, so I bow to your knowledge on this one. However, if you write an app that large numbers of people can't use, they will generally use something else or do without, so you have cut your potential user base. May not matter with a small utility, but if you are trying to sell a full-blown app it does if you want a financial return on your time and effort. This applies just as much to silly MagiC-only programs (eg ASH Emailer) as it does to MiNT-only programs.

> > work on emulators. This is a small market, why restrict your software to
an
> > even smaller potential user base unless it really needs some specific
> > hardware, eg DSP?
> Probably in a way to reunite the users, more focus on some standards by
> forcing using the hard way as obviously the soft way didn't work.

Oh, so it's OK for MiNT developers to try to force people to use MiNT by writing MiNT-only apps (which could be made to work with MagiC if they wanted to do it), because this is "reuniting the users" by "forcing us the hard way", whereas if ASH do it with MagiC-only apps, they are doing a Microsoft and luring everyone into their evil clutches so they can control us all?

We're back to pot-kettle-black, then.

> How many
> of you still don't have an AV-server setup for example?

Mine seems OK for most purposes, though I acknowledge that Magxdesk's AVServer isn't as complete as Thing's. Only affected one program so far (aFTP), in a non-critical way. My AVServer was set up when I installed MagiC, IIRC. What's the point here?

Ah, thank'ee kindly, John.

After a few crashes and reboots I've found the following:

F11 and F12 on their own - no action.
shift F11 Disc Properties
shift F12 Blank screen freeze - avoid!
ALT F11 Emulator Properties
ALT F12 Hmm .. primitive XL screen, I think. ALT F12 again gets you
back to Gem 98
CTL F11 Opening Screen - click to exit to W98 - wah hey!
CTL F12 Re-boot Gemulator

Thanks again, John.

Atari made several versions of their TT-RAM board. Most were upgradeable to 16MB using four 4MB SIMMs, but some could not be upgraded beyond 4MB (the jumpers on the board must be changed to match the amount of RAM installed on the 16MB boards). There were several alternative TT-RAM boards that could be upgraded up to 256MB.

Same here, which is why I basically stopped fiddling with it. My current MiNT setup works and I don't always need the latest buzz.

Still, it took me ages to get it to this point...

> 2. MiNT isn't readily available in a form which newbies can use.

Here I have to agree: while MultiTOS came with its own installer, the newer kernel and gizmos require a _lot_ more reading and hand configuring.

> MiNTnet makes more sense if you are trying to set up a LAN
> etc, for online use STinG is less trouble and works with TOS

Here, I don't agree.

I _never_ understood STinG's config format, nor got something stable out of it, even on a single-user system.

With PPP-Kit (and later, the full KEMD), everything was clearly explained (Thanks kellis!) and worked instantly. The only quible is that some important MAN pages were omitted from KGMD, making it somewhat difficult to optimize the settings, at first.

> And Thing works fine with only Geneva, but not with MiNT+Geneva.

Sorry? As far as I know, Thing (unpatched) doesn't work properly under
Geneva /without/ MiNT (due to a bug in Geneva's shel_write() code), but
/with/ MiNT, it's no problem.

See http://www.deja.com/=dnc/getdoc.xp?AN=483949820 for details on how
to patch Thing for use with Geneva without MiNT.

Ciao

Thomas

Derryck, would like to thank you for
providing an answer here. Atarigalen, (what's a
galen?) did his advice get you where you needed
to go?

I have another question, is there any way to
organize E-mail addresses into mailing lists?

Under netscape you can collect E-mail
aliases into a folder, and then when you want to
write a group of people, simply drag the folder
into your message and thus write that group of
people.

What would be the Atari / Newsie solution
for this? (One of the few things I have to use
the Macintosh for.. this will just about polish
off the use of it, and get me off my wife's
computer.) ;)

Apparently so. :)

I've learned in the Atari world that the
best products are those that hit you broadside
like a 2 x 4 that you least expect.

I've noticed that announced things never
happen. Unannounced things (ie. things that are
not put under pressure due to prior advertising
and promises) tend to just APPEAR.

This is truly the trend that I've noticed in
the current Atari community/market.

Hey, I always love it when someone else
starts a topic I'm going to ask about.

Alright, I have a TT with the standard 2 meg
ST ram and a ST ram daughter board. Total ram, 4
meg ST.
Apparently no TT ram.

So whne would TT ram be used? What are some
good ways to upgrade this ram?

Thanks,

Doctor Clu

(who is happy with 4 megs ST ram, but I know
that more ram would help with emulators
(Spectre), and with CAB webbrowsing (CAche), and
that TT ram is said to be faster. Beyond that,
this is a dream machine....)

How about connecting a regular TV set up to
the device to get it started and then disconnect
it when you are done? Does your computer have
the modulator on it? I have a few with it.
Really nice to use regular TV's with the ST.
Makes for a much nicer looking living room, and a
much more forgiving wife. ;)

>IIRC. What's the point here?

Just my two cents/pence/ï¿½re worth of comments.

MagiC isn`t that bad, in fact I like it.
IConnect works perfectly here on my setup. Almost nothing to config, just type in the userkode,- password,- post and mailserver,- the modem initstring and the phone. That was all there was to it.

As for the AVServer it works to,- very good actually. No problems with Drag- and Drop files in or out of the Fifi (the ftp program) window, if I want to. Start Fifi, an it connect to the net with Iconnect, as does CAB and ASH Emailer. And for that matter, every other Apps I have from ASH,- beeing Texel or Papillon.

The price is fair to, I think. It isn`t like in the MAC world or for that matter the MS/PC world. Don`t expect to get GoLive Cyberstudio or PhotoShop for the price of Homepage Penguin or Papillon.

All in all, I am a satisfied MagiC costumer of ASH, it`s just that I have some small improvement I like to see in the future software.

cheers

Joergen

I had big problems to get it to work at all when i got my Rage ATI card
but now it works.
The Rage setup is very sensitive for the position in the auto folder.
Then i had to manualy edit the the config files for NVDI.

You need one of the WAD files mentioned in the docs.
I followed one of the links from Patrice's www page and got
a demo Doom WAD version 1.8.

This needs to be renamed DOOM1.WAD for PM-DOOM to find it.

> painted red inside), you may be right.

I've got a TT with daughterboard (originally with TOS 3.01 and two
ventilators). Here, the ST RAM (a comparably big card) sits right hand side
underneath the harddisk, while the floppy drive is on the left side of it
(in the middle of the front side). The TT RAM slot and the TT RAM card are
on left hand side, on top of the CPU. So you have something like that from
left to right: TT RAM, floppy drive, ST RAM.

> JA>Is the computer not detecting the daughterboard or something? I
> JA>apologize for my lack of experience (this is my first high-end Atari).
> I think, your TT is all right. It may run without any TT RAM, but with

^^
It won't run without ST RAM. It tells you that there are 4 MB.
If you have both, ST and TT RAM, it will tell you during RAM test (unless
you have TOS 3.01) that it detects both.

> If I'm not wrong, all TTs came with 2 MB ST RAM on board, and there
> are extension cards with 2 or 8 megs, which gives 4 (your case, I

Some TTs were shipped with 4 MB ST RAM, like mine.

> Made by Aixit.

Don't the Aixit boards have PS/2 SIMMs? The Mighty Mic in my TT needs the older ones with 30 connectors. It can be equipped with 32 MB RAM, 8 SIMMs with 4 MB each, but I was told that the power supply might be too weak and might cause crashes. It does work perfectly well with 20 MB (4x 1 MB + 4x 4 MB) though.

Perhaps you first try to find out its name. It really depends in the card.

Hi,

yup, I've got one of the latest (if not *the* latest) Aixit boards.
Two slots for 72 pin SIMMS. Had lotsa problem to locate one 64 Mb
SIMM. It can handle 2x128 Mb, the problem is finding them :-)
My PSU didn't give up on putting the board with one 64 meg SIMM in.
Probably old config of 4x4 Megs eats more than a recent 64 Meg type
will.

Source record: 72303

Hey again anyone :).....noticed something today that in one way or another i thought wasn't right.....my c drive had/has only 8 mb's allocated to it.....and those other drive letters i had been seeing when using selectric to switch from floppy to my hard disk, but was neglecting to really put two and two together until finally it struck me.....I HAVE a megafile 30....so where'd my other 22 mb's go.....errr, well there just happens to be a d and an e partition.....why exactly i didn't know....and still don't....i thought intially when i first got the drive and had been doing any and all things i could imagine to get it working thought that i may have accidentally partioned it off a few times.....so i figure i'll just copy what files i need to disk and start over.....well guess what??? I still have 3 partions.....i've been using the atari hard disk utilites i was given with the hard drive to install it and format it, not sure of the version but it's from 87.....specifically hdx.prg, and hinstall.prg, i dunno....i would imagine that i should be able to use all 30 mb's in one large partion.....and or to be able to access the drives from the desktop other than by selectric, right now i can only access c.....also i seem to have 3 mb's of memory on my system(a mst2) is that out of the ordinary??? i was kinda hapilly suprised as the guy who sold it to me said there was only 2 in it....

:> problem here?

You dont have a problem with that ACC, your answer is elswhere, try
hitting the reset switch, then CNTRL. ALT, SHIFT. This should bypass
the loading of AUTO prgs and accesories. You should then be able to
access your C Drive.

:> So is my hard drive now just a doorstop or what?

Youve a few more tests to make before that scenario.

Take a look at http://atari.nvg.org/newbiemint/, it's a first draft of a
MultiTOS-like distribution I'm working on. Try it out if you dare, but
plase note that it's not finished at all.

>> MiNTnet makes more sense if you are trying to set up a LAN

Ditto, I've always found STiNG confusing too. It works very well once it's
up though, but it's not at all easy to figure out.

Hello, everyone.. gotta scrape together some cash after buying my Falcon. :) I'm stuck on the Canadian west coast with these three systems...

For Sale: Atari ST Systems
==========
* Atari 520STFM (**upgraded to 1MB RAM**). Package includes mouse, SC1224 color monitor and Star-NX1000 multi-font dot-matrix priner. Everything is very clean and in excellent condition. $125CDN OBO.

* Atari 520STFM w/flaky mouse ports and one missing contact pad on the (*) key on the numeric pad. Everything else works fine. $20CDN.

* Atari 520STFM w/flaky mouse ports and dead floppy drive. All other components are OK. $25CDN.

Also For Sale: Atari ST Accessories
==========
* MegaSTe keyboard--works with MegaST, MegaSTe, TT or DEKA/DEKA2 box. $15.

Take the lot (all things listed above) for $140CDN! ($45 off.) Get these out of my sight! :) Buyer pays for shipping from Vancouver, BC, Canada.

Reply to the above e-mail address or this group.

Have a good one!
Derek Warren

If Newsie doesn't support aliases (I don't know), OKAMI is the
best solution :)
Okami + NEWSwach + POPwatch = mail + news
When using Okami 2.1 you can get more than most PC programs can offer.

Thanks to Derryck and Martin,

I have found the cause of my problems with GEM Ghostscript.

I had been working in a 64k colour resolution but once I switched
to 256 colours, which I hardly ever do these days, it started
working fine.

It takes about 1 minute to display the first page of a graphic intensive doc
on my Milan and then about 20 seconds for each similar page.

I have just gotten Ghostscript to print on my new Canon BJC2000 using the
BJC600 setting.

I'm delighted.

Many Thanks, especially to Christian for working on GEM Ghostscipt in the
first place.

Peter

on the subject of How can i detect if my Floppy drive is.
>See if the desktop will allow a double sided format, then do a show
>info on the resulting disk, if its 720k youve a DS drive.

All the single sided STFM's I've come across, and got, give you the
option to format a double sided drive even if you have a single sided
drive.

Getting the disk info isn't a guarantee as I've come across some double
sided disks that has the director on side A/0 as opposed to B/1.

Unless you have a disk that is 200% double sided, the format test is the
best bet.

I have, and I didn't like it at all. OK, it offers a much better OS than
plain TOS (but then you can run MiNT/N.AES or MagiC under GEMulator too),
but the screen-updates were way to slow for what I'm expecting from a
500MHz PIII with DirectX.

Currently the only method to have multiple recipients in an email is
via the NickNames dialog, found in the Mail menu (Edit Nicknames...).

Create a nickname, and then add the email addresses you want into that
nickname. I think the limit is around 100 names per nickname, but I
don't remember. Edit Nicknames works with your Address Books. so you
can click on the dialog and select an email address presented there to
be associated with that nickname.

It is documented (somewhat) in NEWSie.DOC in the Zip distribution
file.

I hope this helps,
John

The battery is for the clock only. There is no CMOS on an ATARI like on a PC.
Try and find ahdi.prg or ICDboot.prg and run these in the autofolder or from the desktop.
If the harddrive shows up correctly only the bootsector got corrupted. Reinstalling the driver will correct that.

(rename shdriver.sys or .raw to ahdi.prg or anything.prg and run it)

Dr.Matrix <drmatrix@hotmail.com> wrote in message news:7sopkgfja1@news1.fast.net...
I have a STACY 4 that has been working fine for many years. Yesterday, I
turned it on and the hard drive failed to boot up. Could this be a CMOS bios
loss? Is there a battery to replace? Where do you find it and how to
replace? Once replaced, how do you restore the original settings to get back
to hard drive? Any help would be greatly appreciated. Thanks to anyone who
will help.

It seemed pretty straightforward for me, but then I'd used STiK previously
and the configs are very similar. What confused me at first was the running
order in the Auto folder, with STinG loading after HSModem. Years of making
sure HSM was the last thing to load was a habit difficult to break. Also
slightly confusing was the need to set the port to inactive for dial-up
connections. But that was because of the LAN stuff which STiK didn't have.

Anyway, each to his/her own. I'm also getting interested in the MiNTnet port
for MagiC, the prospect of which will doubtless give Kellis a fit :-)

The ST RAM should be on right hand side, the TT RAM card on left hand side.

> The TT is not keeping the time, what type of battery is installed,
> where is it on the board and how do I change it?

Usually these are Lithium batteries. Two different types are possible: a
cubic one or an elongated one. The cube has 9 Volts(?) - not quite sure
though. I had it exchanged. Now 4 Mignon batteries do the job.

> Which is the best port to attach my 56K USR modem what baud rate can I
> expect to get?

Best would be Serial 2, it can do up to 230400 bps, if you install HSModa
07. If you go for the other one, Modem 2, you might encounter problems at
higher rates. The speeds from 38400 bps onwards are non-standard.

> The TT came with an Atati PC1426 vga monitor what resolutions can be
> displayed on this?

Not quite sure about that, my TT has a TTM monochrome monitor, so I am not
used to fiddle around with the different possible resolutions. I guess you
can do ST middle and ST low, ST middle is something around 640 x
200something, but they donï¿½t have a good rate, only 60 Hz or so.
Somebody else can answer this question a lot better than me.

Regards,

Kerstin

I bought my 1040STE in 1990, opened it up a couple of years ago to find the 4x256k memory chips attached directly to the board. I assume they're SIPPs but I wasn't sure if they were soldered or not, I tried to prise one out but it wouldn't budge. I'd love to be able to upgrade to 4meg and if anyone could advise me further I'd be dead grateful.

Cheers

>>

One thing to try is to go to some imaginary URL. This can be hard
sometimes since there are so many names taken now. Just try a few until
you hit one. Any way. When you find a non existant one you should get one
of two things. Either the normal old CAB not finding the page report or a
page listing what you were trying for and why it didn't come through. If
you get the second near the bottom of the page somewhere you should see a
litle item called squid. If you have this all I can suggest is that if it
is really bothering you, talk to your ISP about a way to get around it.

Squid is server software designed to reduce the trafic on the
internet. A lofty ideal! However it has some serious problems. I had
serious problems if I connect to the lines with the squid server at home.
Such as tracking via UPS. Squid will routinely return the last page that
I requested even though if I check it without going through squid (special
phone number in my case) then it is indeed updated. I have had problems
with graphics from time to time with the squid service.
```

However you might find that you don't mind the squid service.
It's strictly a case by case user appreciation. Connections to the squid server are generally faster so that you will find a majority of common sites you might hit, come down at a consistent rate all the time. It also acts as a server side proxy. So there might be sites that normally you would not be able to get to without squid.

It has a good goal. And is not bad as long as you don't fit into a use class that it has problems with. Anyway try the above and see if you are encountering squid out there or not.

Dan Ackerman

592. ST Floppy Port Questions

Newsgroup: comp.sys.atari.st
Date: 1999-10-11 00:00:00 UTC
From: Chris Martin <dark_helmet@bigfoot.com>
Message-ID: <3801EBA6.1CED0BB1@bigfoot.com>
Source record: 72201

All,

Does anyone have any information on the 520ST floppy port? I would
be interested in timing diagramings and pin functions. I have a copy
of the WD1772 spec and can figure out most of the pin functions except
Pin 2 - "Side 0 Select", Pin 5 - "Drive 0 Select" and Pin 6 - "Drive 1
Select"; though, I can guess what these do. However, I don't know
the timing.

What I really want to do, and I do not know if it is possible yet, is
connect the floppy port of my ST up to the parallel port of my TT030
or PC and "emulate" the floppy drive. This would kinda be an APE
(Atari Peripheral Emulator, for the 8-bit Atari) for the ST computer.
My disk drive will not last forever, and I want to bypass turning
my disk images into disks if possible.

Anyway, if anyone has any information on the floppy port, or if you
have knowledge of a project like this, let me know.

Thanks,
Chris

Cobblers! The program was very well supported and every feature I
requested, or bugs found, very added or fixed respectively. The only
problem was with the development of ICE - Dave moved on to the PC ahead
of Phil and the problems with ICE were never fixed.

It's velcro'd to the case & the plugged into the motherboard via a
connector. You can replace it with a standard PC-type lithium
battery, but I'm cheap: I bought one of those packs that hold 4-AA
batteries & use that.

>
>The TT came with an Atati PC1426 vga monitor what resolutions can be

Under Options/Set Preferences on the desktop, you can see the possible
resolutions. With a colour monitor you can select ST low/medium/high,
and TT low/medium. You can only get TT high with a mono ECL monitor
(nice but relatively expensive).

597. UK Adventurers Convention

Newsgroup: comp.sys.atari.st
Date: 1999-10-11 00:00:00 UTC
From: karen <karvic@btinternet.com>
Message-ID: <7tt79qoas2@uranium.btinternet.com>
Source record: 72206

Just a reminder about the UK Adventurers Convention in Birmingham at the end of this month. Details below:

The 10th Anniversary Adventurer`s Convention

The Royal Angus Thistle Hotel, Birmingham, Saturday, 30th October, 1999, 9am to 6pm.

Well - who'd have thought that we'd still be going strong after 10 years!

As usual the convention will run from 9am on the Saturday until 6pm and will still cover all formats. Tables will be available if you wish to bring your own computer, and we actively encourage this, so the more the merrier! You are welcome to bring along software/hardware for sale too, although no pirated software please.

Adventurers come from all over the country, including Northern Ireland, and the atmosphere is very friendly and informal. Many of us stay overnight at the hotel and the Friday and Saturday evenings are just as lively and entertaining as the Convention itself. We still haven't managed to attract anyone from outside the UK but we are still living in hope!

During the day we have the popular Megapoints competition running in which contestants get 20 minutes playing time at a specially written i-f adventure, with the object of scoring as many points as possible in the allotted time. There are usually cash prizes and certificates for the 3 highest scorers. (Well everyone says we should be certified!) The game this year is being written by Edwina Brown, and the only information we have is that it will celebrate our 10th Anniversary.

Tickets are available now, and in honour of our anniversary, the price has been lowered to £5 per person. See details below for obtaining them.

The Royal Angus Thistle Hotel has again given us special room rates for those attending. These include full English breakfast and are:- Single Room £40 per person per night, and Double Room or Twin £35 per person per night. Please contact the Hotel direct to book your rooms - the address is The Royal Angus Thistle Hotel, St Chad's, Queensway, Birmingham B4 6HY, telephone 0121 236 4211 and we would suggest that you book early. Make sure you tell the Hotel that you are attending the Adventurers Convention otherwise the room prices are about double the above!

If you have any queries about the convention, or would like to reserve tables for hardware or software please contact either Larry Horsfield or Karen Tyers:

email: Larry - alaric@larryhorsfield.demon.co.uk

Karen - karvic@btinternet.com

Do come and join us, even if only for the Saturday. If you've never been before, you'll have a great time, and maybe you'll at last be able to put faces to those names you've only heard about, and you'll certainly go home with a lot of new friends. If you have been before, but perhaps only to the earlier conventions, you'll be able to renew old friendships. We'll look forward to seeing you there.

1) I'm trying to find a pritner for my Falcon but it's proving a hard task! I've been looking at the Canon BJC-4650 and the Epson Photo EX (A3 is desirable). However I know that a lot of printers these days only work completely with Windows. I've been onto Canon for about 4 weeks - they don't seem to understand my questions! I'm basicaly trying to find out what facilities would be missing by not using Windows. Their final reply is that I won't be able to use A3 (why I don't know) nor the photo realism. Can anyone shed any light on whether the BJC-4650 or the Epson will work satisfactorily - all I need to be able to do is print at at least 720 dpi on A3, photo realism is not necessary. Alternatively, are there any other printers that fit the bill?

2) I'm having problems with Newsie's FTP client and need an alternative. Are there any that will work with Sting and plain single TOS on a Falcon? AFTP seemingly won't work.

Somewhere back in the distant past there was some correspondence on this. I am certain that my TT (and I understand it was an early 'return' from Atari which I got cheap through System Solutions) _needed_ a 6v battery to work properly. Others were certain that theirs needed a 3.6v battery. I know that mine did not keep proper time with 3.6v.

The battery should be around the hard drive bay somewhere. Lift the hard drive lid and look about. See what voltage it says and get that. Maplins in the UK have a suitable one for my TT although I have a feeling I had to solder the leads.

It sounds as if you want colour and I am unable to advise on that. I have been using HP LaserJets for years now and have had no problems. Admittedly all black and white at A4 but the printed output at 600 dpi is very good. HP have an A3 laser printer which I would be tempted to try if I could afford it and had the desk space - it prints A4 sideways and is therefore quicker than a normal A4 printer. They have colour A4 lasers as well but I have no idea if drivers are available.

Lucky you.

This is not my recollection, which is of disgruntled posts (mostly in demon.ip.support.atari, if memory serves) from people who'd paid the UKP30 and whose emails were being ignored by the authors and who were having very real problems due to the state the program was in. The authors got away with all the bugs in early versions of O1 as it was free to start with and later on only UKP10 to register, by which time it was reasonably stable. Fair enough. However, for 30 quid I for one would have expected more, both in terms of the stability of the program and the support.

The complaints from registered users, plus the fact that I couldn't get the unregistered versions (I tried several) to work even vaguely usably on my STE (ISTR perpetual crashes, multiple redraws, other display problems such as blank windows etc), persuaded me to leave the cash in the bank and keep using O1 (which I'd registered, having been very grateful for it at the time and having used it from quite an early version despite its quirks) until something much better came along in the form of Okami.

Congratulations on getting an Atari TT. I
have recently picked one up (machine of Dan
Mazorowski) and it has been a great machine.
Mine came with 4 megs ST ram and no TT ram to the
best of my knownledge, but I plan to upgrade the
TT ram soon.

As for the battery, lift the hard drive
hatch (that hatch is so cool) BTW, to do this,
unscrew the silver screw that is beneath the
computer towards the front-right. I have left
this screw undone since I opened it. That hatch
is great for quick access to the hard drive and
ST ram daughterboard. Simply ingenious!

Once you remove the hatch, look to the back
of the computer. You'll see the battery
connected to the back wall with velco (usually).
The battery itself is connected to a little plug
on the motherboard usually to the right of the
battery itself.

I have yet to replace my battery, but one
thing is for certain, the computer does better
with no battery, than with a dead battery plugged
up.

Hi Folks..

I've got NVDI4.1 and Papyrus GOld 3.62 (I 've got a v4 U/G disk but haven't installed yet). I've got a couple of .TTF fonts loaded up (for testing purposes more than anything else) from a CDROM of such things meant for the PC....How do I use them in Papyrus?....Any action I try to take with the Font Panel ends up with not seeing them or else being told they're not GEM or Signum if I try to load and register them. ...

chrisc

608. Dr Uwe Seimet, please respond..

Source record: 72217

Hi to Uwe and anyone else reading this...it isn't personal, so I'm not fussed..

WEith HD-Driver and the Falcon IDE...If I connect an LS-120 can I get it to log as B: ? Is the LS120 bootable as far as the Atari is concerned?....It's just that with Mario's ST-IDE interface (which is a straight logical copy of the Falcon's) it would be helpful to be able to boot from an LS-120 that had replaced the floppy drive, and I would be able to sell a copmplewrte upgrade kit consisting of an interface and an LS120 to replace the standard floppy as A: (*which I know that HD-Driver can do, I just don't know if it's bootable. LS120's are bootable in PC's either as Drive C upwards on the IDE port or as A: if used with a special card...
Many thanks for your advice...

IIRC, you place them in a folder that NVDI can see then request NVDI
to 'rescan' or rebuild its fonts. Can't quite remember the exact
terminology or the options you choose, but it's definitely to do with
the NVDI setup.

A few words of advice...

Be VERY careful not to forget the screw is undone
if you do any sort of maintenance work involving
turning the computer upside-down (basically anything
that requires the main case opening and thus having
to undo the "other" screws underneath). Hard disks have
died this way because they just fall out of the
computer. I've seen it happen. I also had a close shave
with my Mega STE's hard disk once, luckily the
ribbon cable stopped it just short of hitting the
floor (bungee-style)

No, I meant, does your TT have 4 MB _on_ the motherboard?

The usual configuration is 2 MB on the motherboard, plus 2 MB or
8 MB on an ST-RAM card.

Chris, I'm sure you don't read half the things we tell you...

:-)

Here's what I posted to you in Zetnet Atarians on the 7th July:

Hi Chris and all

>of stuff too...BUt this Font thing confuses me....I've got loads of
>TrueTypes but I don't seem to be able to find a way to install them. NVDI
>has changed my system font but I don't seem to be able to pick up the Monaco
>one in Papyrus, and all I've got are a handful of fonts that came with
>Papyrus......

First off install NVDI 4. The install program should do all for you.
Basically it will install the main program, install the supplied SpeedoGDOS
fonts to a folder (usually BTFONTS or GEMSYS) and write an assign file and
a very important file called NVDI.INF on your root drive. It will also
write a seriously non readable/editable file called NVDI.FIF which holds
all the font details.

>How do I get NVDI to recognise the fonts, and how do I Papyrus to pick them
>up.....I've been using Pagestreamm for all my WP needs up to now but Papyrus

Look at NVDI.INF and you will see path details of where your fonts live.
You can add any TrueType fonts you want to this folder, and next time you
boot up NVDI.PRG will run and pick them up and add the details to the
NVDI.FIF file. But one thing I have found is that if you add new fonts,
delete the NVDI.FIF file before rebooting, because the file doesn't always
get overwritten and new fonts are not loaded.

Now install Papyrus (bearing in mind that HiSoft never altered the install
script so that the main program was actually installed!), and when you run
the program you should see that it has picked the TrueType fonts up and you
can play to your heart's content! Papyrus can use it's own printer drivers,
or use the NVDI ones (devices 21 & 22) - your choice.

If you want to temporarily 'hide' some fonts from NVDI, but don't want to delete them, make a folder within BTFONTS or GEMSYS (whatever your NVDI.INF file says) called HIDE, then move the fonts across into it. NVDI, next time it runs and writes additions to the NVDI.FIF file, will ignore any fonts lurking in the HIDE folder.

>is a lot better so I want to use it instead.....I'm using a 14Mb Nemesised

Papyrus is excellent for most jobs. AC is almost entirely done using it. It's main weaknesses lie in the graphic handling department, ie it's so damn slow! I still use version 4 for a number of reasons, but version 7 and above look very good, and I can't wait for an English release!

HTH.

Kind regards

Mike Kerslake

This is really frustrating.....i can NOT get a single archiving program i've downloaded to do what i want it to do mainly decompress any of the files that i desperatly need and have d/l'd! Can anyone recomend a painless archiver that will handle most all file formats.....zoo, arc, lzh....etc, and well , i'm still in the process of trying to get my hard drive to quit partioning itself.....it seems there's some sort of configuration file named wincap that has something to do with it....(from the file it looks like the biggest partion size is only 16mb's and thats still only one....the other two are fixed at 8 and 6 i haven't changed anything to it yet only cause i don't want to screw anything up......but i did download a newer version of ahdi, and Was going to see if that would help me out a little.....but now i am stuck with this obstacle......i'd really just rather handling decompressing files on my pc.....i can handle zips and lzh's and supposedly there's some other extender program for winzip that will handle arc files.....and i remember seing it but where i don't know anymore.......

When I attempt to get all groups from the server, nothing happens. Is
there another server I might try?

BTW, I now have Newsie's email and WWW parts up for sure -- I think FTP
is, but I'm not sure.

Also using Win98 I...
1) Press <Alt-Enter> to switch the Atari desktop from full screen into
a window.
2) Press <F11> to switch from Atari to Win98 mouse pointer.
3) Click on the little "X" close box.

If this doesn't work for you, I suspect you have a conflict somewhere.

Very cool. I've been an Atarian since 1988 and although I've made MiNT
drives on my EZ135 Syquest, I've never run MiNT on a daily basis
because I couldn't afford to play "what if" games with my primary
computer (yep, still use a Falcon at home). A version of MiNT that I
can get running within a day that doesn't cause too many problems would
be well welcomed.

Does anyone use a hard drive compression utility similar to those found in the PC world? My 40 meg HD on my Stacy 4 is getting pretty full. If there are shareware or freeware ones out there that would be great. I think there was a commercial program written by Oregon Research but I'm not sure where I'd get it or what it was called.

I am developing Atari NOS. You can find it on my web page. I added a GEM
interface too, tought still at the beginning. NOS is a free program available
for many platforms, it was used by Oasis as the connection program.

p> the ole 1.35E version. Can this updated NOS be used with v.1.35E?

Basic script working of NOS should still be working, the problem is that
Oasis is dead before start working.

p> And if the programmer(s) of Oasis never intend to start working on
p> the Atari version again, Maybe someone should pick it up where
p> they left off. I'd really like to see it come about as it looked
p> like alot of work went into making it.

I may event think to add Oasis parts to NOS, eventually as module, but can
you find the sources ?

I bypassed the problem using net2net, jetmail and LED.

Hi Paul,

PM>The TT has come with 4mb ST RAM and 4mb TT Ram can I upgrade the TT
PM>RAM it looks like there is an Atari board in the machine there is a
PM>manual for an Atari TT/ST Ram board,
for upgrading you need RAM extension cards. The ST RAM is to be found
beneath the hard disc drive, whereas the TT RAM card is located left
to the floppy drive.

PM>The TT is not keeping the time, what type of battery is installed,
PM>where is it on the board and how do I change it?
the original is bit expensive (and there are two types, one with 6
V and one with 3.6 V).

You may replace it by 4 ordinary 1.5V batteries (in Germany called
"Mignon").

In the original TT box it's placed behind the internal hard disc drive
on the inside of the rear cover.

PM>Which is the best port to attach my 56K USR modem what baud rate can I
PM>expect to get?
The fastest port is SERIAL2 which allows me a computer<->modem speed
of 230k4. My average speed to the internet is 50.666 b/s.

PM>The TT came with an Atati PC1426 vga monitor what resolutions can be
PM>displayed on this?
With no graphics card, at least TT medium, maybe TT low and some ST
resolutions, but no TT High.

Peter

hi Folkert,

FR>I figure it is most likely as you say.
sorry!

FR>I was just offered a Syquest EZflyer 230 for free from a = friend
FR>along with many cartridges so I am in luck there.
ok, if you need not pay anything, it might be right.

FR>That is not how diskdrives work.
Why not? That drive has two heads, one is working from the top and the
second from the bottom. So one head being crashed, you may go on
working with half of both original capacity...

FR>Now, to chase down some way = to get some very important stuff of of a
FR>number of 44's that I have.
My very personal opinion : Keep away from SyQuest 3.5" drives!!

I had a 44 meg drive that has been running without any problems since
'91 (and still is continuing to do so!). But the 3.5" (270 megs) drive
ran into problems after just one year.

I was lucky to sell all my cartridges and threw away the drive! Never
again!

639. CAB OVLs which version works best?

Newsgroup: comp.sys.atari.st
Date: 1999-10-11 00:00:00 UTC
From: phantomm@kih.net
Message-ID: <7ts03p$aj51@news.ajou.ac.kr>
Source record: 72339

Lately I've been experimenting with different versions
of Dans OVL's for CAB.

Currently I'm using STinG and CAB v.2.7 on a Falcon.

The OVL i've been using is one of the older 030 versions
1.311 or something like that.

One problem I'm running into lately is that alot of Web
pages are not completely loading up when first accessed.
I'll get the text, but the pictures are missing.
If I reload the page while online this usually solves the
problem. This also happens with some of the newer OVL's
as well.

The Speed of the 030 OVL I'm using is fairly fast, but this
loading problem makes it unuseable.

Is this for sure a OVL problem?

Can anyone recommend a good version for use on the Falcon with
STinG?

Also, does Online Printing of Web pages have anything to do
with the OVL you are using?

Any help is appreciated,
phantomm@kih.net

Hello Jo,

j> I have, and I didn't like it at all.
OK, I tried every emulator available and just wanted to state an other opinion than yours. ;-)

j> OK, it offers a much better OS than
j> plain TOS (but then you can run MiNT/N.AES or MagiC under GEMulator too),
I didn't want to stress that. Beyond the OS and its posibilities: I wanted to
point out, that with MagiC PC running TOS (*not* MagiC) you got the most compatible Atari emulator available.

Obviously I misunderstood your term "most realistic". I thought you meant

something like "runs as most Atari applications as possible".

j> but the screen-updates were way to slow for what I'm expecting from a
j> 500MHz PIII with DirectX.
Maybe you have to set up the number of screen updates, or, if you use higher
resolutions than 640*400 up to true color, you have to install NVDI (PC) too.

Can't see that slow down at my system (which is indeed much slower).

Greetings, Oliver

From: french-lines@usa.net
Message-ID: <7tsbpphkp1@nnrp1.deja.com>
Source record: 72342

Hi,

Many years ago, I acquired a "PC-Speed" hardware device from SACK Electronic GmbH, which would plug over the 68000 CPU of an ATARI STe, and give access to DOS based programs.

In fact, I never went on to installing the device, (probably because I didn't want to void the ATARI's warranty), and the box laid in the back of a drawer for many years. Finally, I have decided to give it a go. I have all that is necessary (the board, the software) except the installation leaflet which presumably explains the hardware installation procedure (in particular, which way round you should install the board). My board is specifically for STe's (square type CPU).

So, if anyone has experience with this, and has kept the installation leaflet, I would be very grateful if you could send a copy (either scanned leaflet, or just the instructions).

Thanks in advance,

Patrick

Only "HP 35480A T603 Sequential Access" is displayed by the ID check
function of HDDRUTIL. Everything else is from a data sheet I guess.

>or Signum if I try to load and register them. ...

Hi Chris - try NVDI 3, which is less fussy with 'cheap' fonts. Even with
font checking switched off, I can't get many of the fonts from the
'Monster CD' to work with 4, but they are OK with 3 (with sometimes a
damaged character). The other thing is that those fonts originally had a
'.TT_' extension, and I had to get Derryck to unpack/convert them on a
PC to a '.TTF' format.

Hi!

KE>The MiNT
KE>development team decompiling magic os? for what? when The Magic author
KE>just to stick with the rules only has to read the MiNT kernel src.

Hmmm, what do you mean? That the MagiC author always has to look through the MiNT kernel src to see if it has some new features that then have to be included to MagiC?

KE>Magic people have tried to work with the MiNT people, I don't know, I
KE>don't think anyone can say that, nor the opposite.

At least both MagiC and N.AES seem to make some steps into the right direction. And as long/soon I can run GEM apps on both OS without problems I'll be happy with it. The user will then be able to choose the OS he likes without having to care that his GEM apps won't run vice versa. And when he needs a very flexible unix like environment he'll surely go for a MiNT setup. And as I want to start some Perl programming and also would like to play with the unix stuff I'll buy N.AES 2 soon. But why force people to use one OS when Atarians have the luxury to choose between two OS that are more or less (hopefully soon more :-)) compatible with each other?

KE>It seems, everytime I see something
KE>pushing Magic as being the leader, the best, the ONLY OS for atari,
KE>That really is a slap in the face for many people. That concerns me.

Well, who or what did that? And when people in newsgroup discussions push an OS in that way you can't really count that as being an official tactic to eliminate MiNT. And when MiNTers have nothing better to do than doing the same in the other direction it is the same slap in the face for the MagiC author and the people that are involved in the project.

KE>When I see that MiNTnet can't do PPP, OLGA Magic only, bubbleGEM Magic
KE>only application, NVDI5 etc etc. WHich makes non-sense, this gets
KE>advertized, is wrong information, and all that to promote an OS (which
KE>in my opinion is quite weak, unreliable).

Who advertised OLGA, BubbleGEM and NVDI 5 as MagiC only to promote the OS? I don't like such missinformation tactics either but was it really done on purpose?

KE>Which in my opinion: It would make MUCH more sense
KE>to spend 80% of the development on the core itself, then when stable,
KE>fast, reliable etc, THEN work on the easy install extra programs.

Well if you want to spread your software to a wide public then I would take the time needed to make a software that does what it should for its first version and is easy to use as well.

KE>Why having a SUPER install for a lame software?

Why having a LAME install for a super software?

KE>Installing software, AS trivial as it may sound, is STILL a piece of cake
KE>as opposed to write the memory management at the kernel level, or
KE>rewriting some Filesystem, etc. Don't you agree?

I don't agree. Where is the coherence between the easy installation of a software and the time that is needed to write the memory management?

KE>I would have some long nights trying to install a software, why not!? Can
KE>you imagine from the develpment side?? Takes months, years to develop. Am
KE>I the only one seeing this?
KE>Higher priorities and better management in the development phases.

Again, where is the coherence? The user normally doesn't say 'Man, this must have been years of work for the author, now I'll pay tribute to this and spend the next nights to try to install this beast!'. The user wants to work with his system, and best thing is when he can do it straight away without learning some unix philisophy.

KE>Can anyone tell me why is gemtrade so crappy? Isn't
KE>supposed to be THE advanced version of Ruftrade?

What type of example should this be? It is crappy because the author only paid attention to the GUI?

KE>1)Not that i want to sound mean, But
KE>probably coz MiNters are probably feeling oppressed, while magicer are
KE>just clueless about anything else, probably due to misinformation
KE>coming from STcomputer, AC-computing, interviews (and whatever).

What type of misinformation do you mean? ST Computer? AC? Interviews?

KE>In my opinion, your 100 bucks
KE>invested in magic was pure loss for your 30 minutes. Singletos would
KE>have achieved your needs. That's what I think. 2 different types of
KE>users, 2 different type of OS.

Hmmm, I think that everyone can judge for himself if the money he spend on something was a pure loss or not. And with Singletos he would probably need 60 minutes as he can't read and answer emails while checking the CAB hotlist and downloading something.:-)

KE>Ignoring MiNT is a big mistake,
KE>especially as of today with more and more src available, better libs,
KE>wider use of the internet in people's home.

Okay, but you couldn't market MiNT/MiNTNet like the iMac as the easy internet kit that people want.;-) And when totally 'clueless' people want to benefit from things like the internet etc. then they really rely on easy to use

software. And Atarians normaly like their system because it is easy to use and powerful.

KE>Years of development wasted
KE>to nill, money wasted by many users here for a discontinued
KE>unsupported software.

Again, the user decides if the money was wasted. If he bought CAB for the features it offered then his money was not wasted as he got what he wanted. And ASH still gives you support for CAB.

KE>How many of you still don't
KE>have an AV-server setup for example? Thanks.

There is an AV server available for Magxdesk and I thought that Thing and jinnee are AV servers straight away?

Regards,
Jan

Find 1 Mb sipps and substitute these for the 256Kb ones.
If necessary connect a wire from pin 18 on all sipps to pin 64 on the
memory controller (A9).

You should be able to see the socket when they are socketed, otherwise
they are soldered. When they're socketed use a fine scewdriver to
prise them up bit by bit (as it were).

David Fletcher <fletcher@liv.ac.uk> wrote in message

659. GEM Family tree

Newsgroup: comp.sys.atari.st
Date: 1999-10-12 00:00:00 UTC
From: lproven@hotmail.com
Message-ID: <memo.19991012064703.2509A@lproven.compulink.co.uk>
Source record: 72149

As some of you may know, the current owner of the Intel version of GEM, Caldera Inc., has released the source under the GPL. There is a project to update it, both to functional parity with Atari GEM & to also to include all the features of all the different versions, from the Atari-like v1.2 up to GEM/5 supplied with some apps.

However, we need to know more about the Atari versions to find out where we're aiming!

You might find it interesting to visit this site:

http://www.deltasoft.com

It's the official homepage of the FreeGEM project. The latest part to be added is a GEM family tree, but we're woefully short of info on the ST versions and subsequent developments.

If anyone can provide more information, please email it to me, and I'll endeavour to collate it and edit it into a coherent whole for Ben to include on the webpage.

We need to know much more about:

TOS versions (specifically, which were released - and what
the differences were)
MagiC
N.AES
NVDI
MiNT
Or anything else anyone cares to tell us about!

I am also interested in pointers to any open source projects on ST or compatible platforms, for possible porting to FreeGEM.

Removing the obvious, use geminfo at lproven.DeSpamHere.cix.co.uk, or the address in the header if you can't follow that.

I think it'd be good if we could create a definitive repository of information about GEM and its relatives - but we PCers will need a bit of help from some Atari experts!

(I've just bought a Mega2 ST to teach myself as much as possible - but it won't be enough.)

Thanks in advance!

Yes, with HDDRIVER you can use the LS-120 as drive B:. I do the same
with my Falcon. You can't boot from this drive, though, since TOS is
responsible for booting in the first place and TOS doesn't look for
(doesn't even know) LS-120 drives when booting. TOS can only boot from
SCSI and "real" IDE devices, not from ATAPI devices like the LS-120.

> just that with Mario's ST-IDE interface (which is a straight logical copy

> the IDE port or as A: if used with a special card...

Note that replacing the floppy disk drive by an LS-120 is not a good
idea. Remember that HDDRIVER is required to access this drive. So if
anything goes wrong and you can't boot HDDRIVER anymore from your hard
disk drive you won't have no access to the LS-120, i. e. you even won't
be able to insert a floppy disk in order to install a new driver on your
hard disk drive. You would have to remove the LS-120 first, add a
standard floppy drive and then proceed.

The VDI version is intended to work on machines with graphics card. On a
standard Falcon, the VDI version work in 16 bits mode. I could add 8
bits support in a future version.

Well, maybe I could add 32 bits support too. Anyone has a graphic card
on his/her Atari that support this ?

That is, it expects a frame buffer with a 'chunky' rather than a bitplane
layout. The 8 bit VDI code simply assumes that a device specific MFDB
should point to byte per pixel data.

>Well, maybe I could add 32 bits support too. Anyone has a graphic card
>on his/her Atari that support this ?

Mine (Eclipse/RageII) does.
I wouldn't want to run DOOM in 32 bit, however, since it's quite slow
enough already in 16 bit (8 bit is quite nice, though (Falcon+AB040)).

BAD MOOD isn't a port. It's from before the sources were released.

>> No sound support, was very slow on my Falcon030 14mb ram. Where can

You're not likely to ever find a faster DOOM version on a Falcon.
(I've not tested Patrice's latest versions of the pre-PM-DOOM project.
Does it run on '040's now?)

>> atari quake engine be aquired from? Thanks...

The first port of Quake to the Atari (some two years ago, IIRC) runs
at somewhere around 5 fps on a Falcon+AB040.
It could perhaps be optimized a bit more, but I'd be very surprised if
it was possible to wring more than a couple of more fps out of it.

You need an '060 (or hardware 3D acceleration) to be able to run Quake
at any really playable frame rates.

Date: 1999-10-12 00:00:00 UTC
From: Richard Karsmakers <richard@fortysecond.net>
Message-ID: <pSMDOPCZgXtGZrIa2UBPmiuoXL5+@4ax.com>
Source record: 72160

This is a rather long message with a lot of names. I am trying to correct or complete a lot of entries in the almost 200-record "ST News International Christmas Coding Convention 2000" database. I am also trying to contact the last batch of people who I have not yet been able to contact. Please take your time to read through the list and see where you can be of assistance. My appreciation would be enormous!

The following people I am looking for, but so far I have not been able to contact them. If you know where they can be found I'd be grateful!

Scavenger ?
Thor of Black Monolith Team
Morten (?) Lysen
Quasar of Aenigmatica
Pulsar of ?
Nemrod of Pendragons
Chris and Ian of The Watchmen
Slime of Delta Force
Cugel of Silents
Acco of The Garlic Eaters
Dan Buehler of Lazer
Belzebub of ST Connexion (Stephane Catala)
Ze Watsit of ST Connexion (Thomas Conte)
Terence of Pendragons (Eric Dezert)
Sylver of Pendragons (Herve Durand)
Frederic Gidouin (author of PacifiST)
Marcus Herfort of The Bitstoppers
Captain Headcrash of Total Vision Inc. (Dirk Hoeschen)
2-Stein of ST Connexion (Julian Jacobs)
Tie Eytsch of Total Vision Inc. (Thorsten Kappe)
Karsten Koeper
Kim Kruger-Monsen of ACA
Foxx (Marcus Laatsch)
DTX Synchron of Legacy (Frederic Lafosse)
Ripley of Reservoir Gods (Natasha Lomas)
Mordor of ST Connexion (Jean-Yves Loze)
Marlon of ST Connexion (Fabian Masson)
Adso of Overlanders (Frederic Payet)
Ford Perfect of Black Monolith Team (Michael Rausch)
Bilbo of Ripped Off (David Scott)
Vector of ? (Jesper Sjostrom)
Humungus of Overlanders (Clausse Vladimir)

The following people have been contacted quite a while ago, but have still not replied. If you know them, maybe you could contact them and ask them if

they've received the invitation. Also, just to be sure, maybe you could send me their email address so I can check if I have the right one:

Loke of DHS
Martina of Lazer
Tox of Avena
Jet of Avena
Tom EE of Avena
Zeus of Teknique
Boris of Avena
Roman of Avena
Bluestar of Sync
TNT (Michael Bittner)
Exyl of Sector One (Guilhem de Cooman)
-me- of The Exceptions
ST Ghost of Sector One (Denis Huguet)
Dynacore of tSCs (Andreas John)
TNT Crew (Christian Jungen)
mOd of ex-tSCc (Thorsten Keltsch)
The Fate of ULM (Christian Limpach)
An Cool of The CareBears (Anders Nilssen)
Mr. Pink of Reservoir Gods (Leon O'Reilly)
Snabel of Omega (Mats Olsson)
Icarus of Electra (Stefan Persson)
Colin Polinowski (Atari Times team)
Jesper Rudberg of Electra
Nut of FUN (Barry Schut)
Llama of tSCc (Martin Schwalb)
Redhead of Sync (Bengt Sjolen)
Walter Vasse of Overlanders
Questlord of Delta Force (Philipp Westner)
Zork of Scum of the Earth (Marinos Yannikos)

Then there's people who I have been in contact with but whose email addresses have gone invalid. Any help in reaching the following people would be appreciated too:

Checksum of Equinox (Claude Agez)
Oxbab of Oxygene (Christophe Balestra)
Alien of ST Connexion (Sengan Baring-Gould)
Gudul of ? (Antoine Buat)
Crystar of Pendragons (Benoit Durand)
Gadget of MCS (Bruno Kerouanton)
Megadeth of Pendragons (Pascal Nowak)
Ajrarn of ST Connexion (Stephane Picard)
Starlion of Equinox (Didier Plaza)
Skyrace of Hemoroids (Stephane Renard)
Mon of Oxygene (Nicolas Simon)
Keops of Equinox (Sebastian Viard)

Granted. Might have helped that Phil and Dave were friends and it was
easy to bug them to add the features I wanted. Then again we were all
running on higher powered machines, Falcon's or TT's. This may have made
the difference.

These items gotta go!!! I need the space!!! They goes
as follows:

System Packages for sale:

System 1: $275.00
* Atari Mega ST
* Color Monitor
* 500 + Hard Drive w/CDRom & Tape backup Drives
(Comes with 20+ Tape Carts, 4 CD case caddies & 1 Atari CD with
lots of programs - <Gemini Atari CD-Rom, Dec. 1993>)
* Atari SM804 w/Outburst (Needs new drum and toner)
* Migraph Hand page scanner
* 14400 Fax Modem
* Programs left on the Hard Dive are: Data Manager, Degas Elete,
Mortcalc, Retcalc, GramSlam, PageStream, Touch UP, WordPerfect,
Animate, AVSPlay, Film Play, GemView Demo, Iff Src, JPEG, Player,
Games: Battle Chess, Battle Ship, Hackman2, Match, Missle Command,
Pinball, Spaceball, Tetris, Games end, STZip, ARC Shell, Esscode, LHARC,
IBM Emulator, Mac Emulator, CalShow6.2A, Geneva, STFax, Warp 9, Stalker,
DB3 Tape Backup Software, G+Plus, Connect, Virus Program and more!

System 2: $150.00
* Atari 1040 w/16 Megs and a switcher (8 to 16 Mhz)
* 130+ Hard Drive (In 2 cases connected by a cable)
* 14400 Fax Modem
* Color Monitor
* Migraph Hand Scanner
* Programs left on the Hard Drive are: Data Manager, Degas Elete, Mortcalc,
Retcalc, GramSlam, PageStream, Touch Up, WordPerfect, Word Write, STZip,
CalShow 6.2, Warp 9, STFax, Stalker, AB Calculator, Games: Loom, Match,
Missle Command, Pac Mania, Speech and more!

Hardware:
* Black & White Monitor ..... $ 15
* External disk Drive (Needs Power Adapter, Radio Shack) . $ 3

Software: All With Manuals
* Easy Draw ..... $ 3
* Degas Elite ..... $ 3
* Typesetter St ..... $ 3
* Stalker/Telecommunication Software ..... $ 3
* G+Plus ..... $ 3
* Migraph OCR/Optical Character Recognition Software ..... $ 3
* Mr Boston Official Bartender's Guide ..... $ 3
* The Juggler ..... $ 3

* Geneva/(Multi Tasking Program) & NeoDesk(Desk Top Prg .. $ 10
* Hyrid Arts Semte Track w/sync box ..... $ 20

Software/No Manuals:
* Hybrid Arts Ludwig Music software ..... $ 1
(Disk Only)

Games: All with Manuals
* F-15 Strike Eagle Flight Simulator ..... $ 2
* Elite/A Fantastic Voyage ..... $ 2
* Defender Of The Crown/Knight Fight ..... $ 2
* Knightmare/Knight Fight ..... $ 2
* ShadowLands/Barbarian Fighting ..... $ 2
* Barbarian/Fighting ..... $ 2
* Lemmings/Maze and Building ..... $ 2
* Ultra V Warrior of Destiny/Knights ..... $ 2
* Baby Jo/Baby Super Hero ..... $ 2
* Drakkhen/Dragons ..... $ 2
* The Pawn/Good and Evil Fight ..... $ 2
* Dragon Of Flame ..... $ 2
* Breach ..... $ 2
* Time Bandit ..... $ 2
* Quest Glory ..... $ 2
* Romancing The Throne ..... $ 2

Games Disk only:
* Dragon Master ..... $ 1
* Rambo 3 ..... $ 1

Programing Software & Book Combination:
* Mark Williams C Compiler/4 Disk/ and Update (2 Disk)
Mark Williams C For The Atari ..... $ 5

* CSD C Source Debugger1 Disk
Mark Williams CSD C Source Debugger For The Atari ST ..... $ 5

Programing Books:
* Prospero C, Language, AES Bining, Library, VDI Binding . $ 5
* Atari ST Internals/The Authoritative Insider guide ..... $ 3
* Atari ST Graphics & Sound/Mastering Capabilities ..... $ 3
* Peeks & Pokes/Hidden Secrets with in the Atari ..... $ 3
* Atari ST Application Programming ..... $ 3
* Atari ST Gem Programmer Reference ..... $ 3

Software Books with no Disks:
* Mark Williams resource Editor For The Atari ..... $ 2

675. problems with Newsie

Newsgroup: comp.sys.atari.st
Date: 1999-10-12 00:00:00 UTC
From: tesla1@telsa1.freeserve.co.uk
Message-ID: <38034d4ea3b750@telsa1.freeserve.co.uk>
Source record: 72165

Hi All,

I was using Newsie for my Newsgroup messages but I found a strange problem.I had been replying to a guy on a newsgroup but after I replied to him about 3 or 4 times the messages were not getting onto the newsgroup even though Newsie had sent them.Has anyone else had this problem? if so is there a cure for it?

Gordy.

Bonjour a tous :)

I coded (renewed exactly) a GEM version of an old game for the MagiC
Contest Online 1999.
It's just a Strip Game, you can download at my homepage
http://rajah.atari.org or directly at
http://www.multimania.com/nef/files/rosemary.zip (250 Ko)

The game is still in French (English version will be available)
but easily understandable.

coded with GFA Basic.

bye

|I've got NVDI4.1 and Papyrus GOld 3.62 (I 've got a v4 U/G disk but haven't
|installed yet). I've got a couple of .TTF fonts loaded up (for testing
|purposes more than anything else) from a CDROM of such things meant for the
|PC....How do I use them in Papyrus?....Any action I try to take with the
|Font Panel ends up with not seeing them or else being told they're not GEM
|or Signum if I try to load and register them. ...

The fonts have to be in an identified location known to NVDI at the time of bootup. I put them in a folder called FONTS in the Papyrus folder but they can be anywhere. You should have a cpx called NCACHE under Control Panel and you can use that to set the path to your font folder (and one or two other things as well).

Once that is done and saved, reboot and you should see the fonts in the folder being listed and checked on the boot screen. Simply open Papyrus and use it, selecting whatever font is required. NB there is no need to Load fonts with the font panel unless you are using e.g. Signum fonts.

It may be your loosing your NNTP connection between post.
Sometimes you get a dialog that indicates the host isn't
available and other times it looks as if your post was sent
(very fast) but it never makes it to the server. I will probably loose
connection typing this. My ISP uses SuperNews, and cannot ping the
NNTP host direct, so I just have to make a "request" every two minutes
of so, or read off line.

Thanks for that.I did send the messages during a buzy time on a
Sunday evening so there may have been a problem because the news
server was so buzy...

Looks like this will not happen Mike. I've been trying to get Phil back
into any sort of coding, and even though initial work was started nothing
has gone any further for at least a year. Dave has lost interest
completely since getting into a new relationship.

>Papyrus Gold 3.62. Obviously I'm doing something wrong....should .TTF's be
>somewhere else?

Hi Chris!

No, I don't think you are doing anything wrong - it's most likely the
fonts themselves that aren't quite perfect (?in the header?), so NVDI4
won't load them. I've had the same problem with several fonts from the
'Monster CD', though NVDI 3 handled them fine!
I had a long correspondence on this with Wilfried Behne, who told me
they had changed the checking procedure and NVDI 4 is more fussy than 3
in this respect.
I tried looking at some of these in Arkus, but though it showed part of
the font details it wouldn't show all in some cases; some displayed the
character set, others didn't.

The only solution is to set up NVDI 3 as an alternative and use that -
or try Speedo-GDOS 5 (I haven't, yet). It's a bit tricky, as many of the
driver files etc that NVDI uses have the same name in both versions but
are different. It can be done by renaming sets of them in X-Boot, but is
tricky.

Regards, /Peter/

Hi Paul,

I can help you with the External floppy drive, and the 4MB SIMMs.

If interested, please e.mail me.

All the very best,

Keith Lever.

I have all mine inside Gemsys that NVDI is set to look,also Pap is set to
look,to add more just drag what u want there an next time NVDI boots it
finds them also make sure your font cache is big enough

|>somewhere else?

Sorry, I seem to have missed the original of this. I had similar
problems with some fonts but I have forgotten where I got them from.
May have been from one of the CDs.

The error message said, for instance, 'found aabb instead of abab'
(giving hex numbers as far as I remember). (Use something such as
HOLDIT to freeze the error message.)

I then used Arkus to look up the actual file.ttf name from the font
name then used DADE to look at the file. There I found the number
'aabb' and changed it to 'abab', saved it and it worked. I have done
this twice and since I was working on a copy I had nothing to lose.

I know I have STick installed and that the old
> cab.ovl needs to be deleted, could that be the problem?

I doubt it: it seems to be failing before the point where the OVL would come
into play. You could try disabling STiK, but the OVL is only activated when
CAB is launched and shouldn't affect PPP negotiation.

> HOw do I know which is the old cab.ovl that came with STick.

The Iconnect OVL which came with my CAB 2.5 is 22751 bytes in size and dated
2/11/97, which may help to identify it.

Those are one of the most difficult faults to diagnose since
they often manifest intermittently, especially with complex
multi-layer boards like the Falcon, which also use tiny SMD
components. Simplest solution is to replace the board. This
depends on what value you place on the data on your hard disk.
After all, it's your data and operating environment settings
that really make the computer personal to you.

Right, OK, got that straight now....that sounds like the best way to do
it...use the IDE for non-mission critical stuff like CDROM and LS-120 as
B:, leave floppy as A: and keep SCSI clear for hard-drives...

>> just that with Mario's ST-IDE interface (which is a straight logical copy
>> of the Falcon's) it would be helpful to be able to boot from an LS-120 that

>standard floppy drive and then proceed.
>

Yeah...this is kinda what I was worried about...that said on an ST you'd be
able to use the interface to get the LS-120 as A:, use an internal 2.5" as
C: and upwards, and then if you ewver needed to get down and dirtty with a
real floppy cos the boot had failed you could always plug in a B: floppy,
which IO'vbe never managed with a Flaocn (though I assume it's just a case
of using a twisted cable like on the PC...it didn't work on an ST and we
tried lots of drives and cable schemes...

That's not that hard to fix....you can point-point it overland on the board with wire....doesn';t look nice but it works...the unfixable one is shorts....If they'll tell you what's broken I can walk you through the fixing procedure..

If your into this sort of thing, get the Falcon Field Service Manual.
You can trace out all the good stuff, and jump the bad spots. I think
the schematics are on the web as well, but they are not a complete
set, and the manual is a must have if your a die hard Falcon person.

Not sure who has your board, but Alex is known to try and fix most
anything. Search him out at ATY Computers, in the San Fransisco area.
Wizztronis is good, but don't seem to have much time for Atari repairs
anymore, and are quite expensive.

Hi Ron,

The name of the utility you need is DataLite and was, as you said. done by
Oregon Research.
As this company no longer exists, I do not know where you might try for
this now........
I bought it (in the UK) from HiSoft and, to be honest, found it not really
usable on lower end machines because it was very slow. However, it came
into its own when I got my TT ! (I have never tried it on my Nemesised
Falcon.)

I have never heard of a freeware or shareware utility of this type - now
that hds are so cheap, I don't suppose many people have a need for it ?

HDDRIVER doesn't have anything to do with setting the time. This has to
be done by special software, usually included in the host adapter
distribution.

Many thanks to all those that replied I have located the battery and
will buy a replacement. I am glad that I got the TT it is a great
machine and runs software a lot faster than my Windows system at work.
Its nice to be using an Atari system again after three years. I get a
kick out of using the TT that I never got when I moved platforms and
started using PCs. It is not alwys geener on the other side!

Thanks again for all your help!

Paul

Depending on which model ST you, depends what answer you'll get.

It is common practice to answer a question or help in a newsgroup VIA
posting to that newsgroup, unless it is of a VERY personal nature!

Since the ST arrived, many versions of TOS have appeared. This has
caused some compatibility problems.

So we it would help to know which model you have:) which machine model
machine, e.g. STE, STFM, STF...

I don't think Okami destroy attachments.
>
>Can Okami handle an E-mail with multible file attachments?

It surely can, but some mails with multiple file attachments especially
those maked with Outlook Epress can cause trouble. If you encounter one
save it as plain text and let an external decoder do the work.
Is this the fault of Okami? Who knows. It can also be a problem of
Outlook Express.
Write to the author of Okami to explain your problem.

Julian Rescke posts here.
He is coauthor of The Complete ATARI ST book if that ever was released
in English <reschke@muenster.de>

Liam G. H. Proven <lproven@hotmail.com> wrote in message
news:memo.19991012064703.2509A@lproven.compulink.co.uk...
As some of you may know, the current owner of the Intel version of
GEM, Caldera Inc., has released the source under the GPL. There is
a project to update it, both to functional parity with Atari GEM &
to also to include all the features of all the different versions,
from the Atari-like v1.2 up to GEM/5 supplied with some apps.

However, we need to know more about the Atari versions to find out
where we're aiming!

You might find it interesting to visit this site:

http://www.deltasoft.com

It's the official homepage of the FreeGEM project. The latest part
to be added is a GEM family tree, but we're woefully short of info
on the ST versions and subsequent developments.

If anyone can provide more information, please email it to me, and
I'll endeavour to collate it and edit it into a coherent whole for
Ben to include on the webpage.

We need to know much more about:

TOS versions (specifically, which were released - and what
the differences were)
MagiC
N.AES
NVDI
MiNT
Or anything else anyone cares to tell us about!

I am also interested in pointers to any open source projects on ST
or compatible platforms, for possible porting to FreeGEM.

Removing the obvious, use geminfo at lproven.DeSpamHere.cix.co.uk,
or the address in the header if you can't follow that.

I think it'd be good if we could create a definitive repository of
information about GEM and its relatives - but we PCers will need a
bit of help from some Atari experts!

(I've just bought a Mega2 ST to teach myself as much as possible -
but it won't be enough.)

Thanks in advance!

> Jeez! Looking for opinions/ideas here. What should/can I do now?

Exchange the motherboard! You can probably find a used Falcon rather cheap - new motherboards from C-lab don't cost much less than a complete Falcon, so that's no alternative if you ask me...
The only way to find such a problem is to check all lines for connectionm which probably means several weeks of continuous work - and LOTS of money for the time spent on it.
However, if your dealer has been able to locate where the broken trace is at, it's fairly easy to repair even if the result won't look very nice - at least if you're experienced with a soldering pen and have a very fine tip on the pen.
BTW - what's wrong with it - is it completely dead or is it a more specific problem? Maybe I can give you a hint.

| . . . .

Sorry for answering my own post. I had set up the new STinG (with help) and then tried using it. NEWSie was fine but when I tried opening a site under CAB there was a whirring from the drive and nothing. That's when I sent my message. However, I have just tried again now and found that a/ it works (with the same CAB.OVL) and b/ it's about 3 times faster. The downloading speed is a minimum of about 1500 (used to be 400-500).

I have ordered a V90 modem and hope for great things. The web might even be usable now with images.

One problem remains and that is a crash when the STinG dialer is an accessory. It works OK but when any other program is started the computer freezes. I now have it assigned to a function key and start it from the desktop and so far it has been alright. Is this STinG in general or the new STinG in particular?

With W95 I find a left click followed by a right click brings up the
W95 pointer so Gemulator can be closed in the normal microsoft way.

In full screen click, with the W95 revealed as above, right click,
a Gemulator box appears, click on exit..

Hello amfreq,

I know nothing about PC unziping etc but on my Atari I use the brilliant
Shell program called "Two-in-One" by Gregor Duchalski which takes a lot of
the pain out of packing and depacking files on the Atari. It supports
STZip,LHarc,Zoo,Unarj,and Arc Plus you can set up extra programs and
Viewers. Give it a try and see how you get on. You can get it from a
number of ftp sites the <ftp.dryden.co.uk> directory: /pub/atari/interactive
being one. You will still need the actual packers themselves but I'm
sure they are all readily available on any number of sites.

Hmm, that's interesting. The first press should be Alt-Enter. The
second is F11. I put them inside < and > marks before and they didn't
show up in the post.

```
JET MOTO 3
THE RUSH IS BACK!
```

Sideswipe enemy racers, hang a hard left at the vertical grapple, and speed your way to the finish line! Jet Moto 3 takes you full throttle through 19 obstacle-filled, bone-smashing environments, as you attempt to conquer subterranean graveyards, ancient cities, volcanic eruptions and alien worlds. 11 insanely fast, all-terrain jet hover bikes, including new riders such as Angel and Convict, will take you on the ride of your life as you jostle, sideswipe and fight for position against the most challenging racer AI to date. You'll feel every bump, bruise and crash with the all-new 3D racing engine with MotoPhysics☐, delivering blazing fast gameplay and crisp, beautifully detailed 3D graphics. Jet Moto 3. THE RUSH IS BACK!

KEY FEATURES:
☐ Race any of the 11 ultra-realistic, all-terrain jet hover bikes. Old favorites like The Max, Wild Ride and Vampeera team with new riders such as Angel and Convict. Each rider/bike boasts his or her own performance ratings for acceleration, top speed and handling.
☐ All-new 3D racing engine with MotoPhysics☐ delivers blazing fast gameplay and beautiful 3D graphics. Experience outstanding handling and even an occasional horizontal and vertical grapple!
☐ 19 treacherous, bone-smashing environments to conquer, including an ancient Inca city, a subterranean graveyard, the gut-wrenching SkyPark, as well as the wildest, most thrilling stunt tracks ever designed!
☐ Feel the effect of eleven different racing surfaces, such as ice, wood, metal, rock, lava, grass and concrete.
☐ Experience realistic weather effects including snow, rain and night racing.
☐ Challenging AI jostle and fight for position by crowding or side-swiping other players.
☐ Rip it up or get wasted in 1 Player modes (Single Race, Season, Circuit and Practice) or 2 Player modes (Single Race or Circuit) with 4 season difficulty levels: Novice, Semi-Pro, Pro and Expert.

```
JET MOTO COMPARISON

741. HELP! Atari ST emulation on iMac

Newsgroup: comp.sys.atari.st
Date: 1999-10-13 00:00:00 UTC
From: Josh Renaud <kirkman@bbs.galilei.com>
Message-ID: <OtcN3.1014$SU1.106450@news1.primary.net>
Source record: 72139

There are some really good Atari ST emulators out right now for the Mac... PowerST and NoSTalgia do a really nice job... But I have a prolbem, because I am using an iMac. I need to transfer my ST files to the iMac, but all my files are on disks, and I can't find any sort of driver that will read the ST disks. (I am using imation's SuperDisk drive)

I had tried the Dust utility for the Mac, which supposedly reads Atari disks and then saves disk images of them on your Mac, but it locks up the computer when I try it, presumably because it wasn't written to work with the USB-port SuperDrive.

Anyone know of a Mac utility that works on the iMac that will let me read my ST disks, or possibly a website or something like that? I want to move everything over.... I've played SunDog that I downloaded from someone's website, but I want to be able to use my own saved games, etc, etc, etc... I can't do it without a way to transfer those disks. Thanks in advance for your help!!

Not possible with AtariWorks, which allows access to printer devices (21-29)
only.

Papyrus would be a better bet IMHO, try the demo from ROM's web page (and use the
NVDI printer, set the NVDI CPX to IMG output as previously discussed).

In uno strano messaggio del 12 Oct 99 aragorn@netcomuk.co.uk (2:333/608.1)
scrisse al povero All :
a> Looks like this will not happen Mike. I've been trying to get Phil back
a> into any sort of coding, and even though initial work was started
a> nothing has gone any further for at least a year. Dave has lost
a> interest completely since getting into a new relationship.

He may agree to give me some sources, but I can't contact him, I'm collecting
sources at the moment to try to build up a free and working ftn+internet
system based on NOS and it is very good at the moment.

There is also a new FiST developer in this picture, he changed the name of
the software but it is still free, so I will go on with Semper, Octopus, NOS,
Jetmail, LED and FiST, and I have all the sources to fine tune this thing.

What I would really like is a web browser too, I made NOS able to work with
CAB but this not satisfactory, but I can't do all myself, so....

anybody is able here to develop a free GEM web browser that I can support
with NOS ?

Sources of CAB 1.5 would be a great starting point, but it's gone commercial,
this is a pain... is there an alternative GEM browser for MiNTnet or else ?

Thankx btw Daron, and congratulations about your actual life, I wrote you for
the last time congratulating for the wedding, how much time passed ? 8^)

.... and NeST is still alive, and it comes here with NOS 8^)

> driver files etc that NVDI uses have the same name in both versions but
> are different. It can be done by renaming sets of them in X-Boot, but is
> tricky.

Also consider finding a friend with a Mac, grabbing TTconvertor for Mac
off the net, and convert the fonts on the Mac with 'Compress font name',
'Delete Mac files', and 'Convert .TTF filenames' options on. This way I
have found very few fonts that I cannot use with NVDI (95% success rate
in converting Mac fonts to a font I can use with NVDI...) That should
help you save a messy setup with two NVDI's resident on your disk!

Kind regards,

Chris Wilkinson, Christchurch, New Zealand.

Complete MIDI sequencing package! Everything you need to get started!

Atari 1040 STe w/SM-147 monitor, Cubase 3.1 (boxed, unregistered)
w/dongle, all disks, and manuals. Will include 2 mice, Atari dust cover,
and all the software I own (DTP, word processing, scanner sotware, Synth
editors, etc. Most in original boxes) Everything looks great and works
perfectly. Great MIDI sequencer!

$280 shipped in (US ONLY)

No COD, No Offers, Prepay Only.

Need to move this asap!

Sent via Deja.com http://www.deja.com/
Before you buy.

> included to MagiC?
Yes I believe the magic author(s)/programer know well enough to avoid such
problems like pexec() (as in, NOT compatible, that means that my prog
won't work the same under magic as they do under MiNT, pexec() was
explained, detailed in books, references and quite established by atari
corp, and the open src is totally viewable by anyone to respect the
behavior of this call. Now how to explain that to a user that the prog
doesn't work right because of internal differences between OS? who to
blame? I don't know...

> some Perl programming and also would like to play with the unix stuff I'll buy
> N.AES 2 soon. But why force people to use one OS when Atarians have the luxury
> to choose between two OS that are more or less (hopefully soon more :-))
> compatible with each other?

If the 2 os were compatible there would be no possible "forcing people"
As long as it works who cares, you're on your own. It would be like
forcing people to use boxkite instead of freedom. They are compatible, you
are then only dealing with some bugs and extra features that do not
interfere. (color of fonts, resizeable, non-blocking windows, drag and
drop fonts and files and such) but the fileselectors do work as expected.
(don't take it literally this is just an example).

> Who advertised OLGA, BubbleGEM and NVDI 5 as MagiC only to promote the OS? I
> don't like such missinformation tactics either but was it really done on
> purpose?
done on purpose? well there is a big statement here, you are responsible
to what you say, "basically, I come forward, next to you, knock you
really hard in the face in the nose, you bleed, and then I would be, oh
man, I didn't mean that, I am sorry" (meanwhile, hiding my smile)
Oh well...

> Why having a LAME install for a super software?
That's a fair choice.
So we have 2 clans then? super install for weak software
and LAME install for super software. I guess that sums up the situation

pretty well.
>
> KE>Installing software, AS trivial as it may sound, is STILL a piece of cake

> unix philisophy.
And learning to play the piano within minutes, otherwise piano sucks coz
you couldn't play a concerto.
To me a computer is not easy, if it was, everyone would have a major in
computer science, or would be a network engineer etc.
Clicking on 1 icon to start an application is sure easy enough, and
nothing wrong about that. Computers are made for more efficient work,
people don't want to deal with them. Fine, I guess that's why people used
GEM with atari at the first place instead of DOS pc in the early days.

GEM singletos is still there, you still can use it, you just need to deal
with its weaknesses. Don't expect it to embed documents across
applications, while spellchecking another document in background while
playing mp3 and converting a mov into a flc file. Some people i believe,
expects some things that are not realizable. ACC DO have limitations. the
original GEMDOS DOES have limitations, you want to share files with your
PC or mac, singletos WILL have limit. Yet people don't want to upgrade
because of the non-coherence between MiNT and magic. Hell can't
even release at least 10 programs I have done, along with some converters
and scripts coz they will not run on anything else than a "similar" setup
as mine.

> > KE>Can anyone tell me why is gemtrade so crappy? Isn't
> KE>supposed to be THE advanced version of Ruftrade?
>
> What type of example should this be? It is crappy because the author only paid
> attention to the GUI?
What else did he have to pay attention to? the mainengine directly came
from ruftrade. The goal was to make this GEM happy. It all failed
miserably if you ask me.

> KE>Ignoring MiNT is a big mistake,
> KE>especially as of today with more and more src available, better libs,
> KE>wider use of the internet in people's home.
>
> Okay, but you couldn't market MiNT/MiNTNet like the iMac as the easy internet
> kit that people want.;-) And when totally 'clueless' people want to benefit
you forget something here, there is no way it could get marketed, as it is
free. The "people" you are talking about do not want linux, yet, linux is
a very successful OS as of today.

> Again, the user decides if the money was wasted. If he bought CAB for the
I agree there...
> features it offered then his money was not wasted as he got what he wanted. And
> ASH still gives you support for CAB.
Well, "support" is quite a strong word that should not be used in this
case. I believe you wanted to use another word as it is totally
inaccurate.

>
> KE>How many of you still don't
> KE>have an AV-server setup for example? Thanks.
>
> There is an AV server available for Magxdesk and I thought that Thing and
> jinnee are AV servers straight away?

Not answering the question at all.
How many have installed (this cut down version) of the av protocol for
magxdesk? (people don't even know what it is, hence it should be installed
standard imo)
How many THEN have it setup? so that *.gif would spawn the correct viewer
etc? send-key? openwind? drag_on_window? askfilefont? status?
How many do have jinnee installed? after all it is very complicated to set
the av-server up. <g>

For CD-ROM drives any ID is allowed since these devices are added on the
GEMDOS level.
For other devices, i. e. hard disk drives and similar peripherals, it
depends on both the operating system and the driver. With plain TOS you
can use the IDs C: to P:. With HDDRIVER A: and B: are allowed, also with
plain TOS. In order to use IDs beyond P: either Big-DOS, MagiC or MiNT
is required.

755. TT Questions Part 2!

Newsgroup: comp.sys.atari.st
Date: 1999-10-14 00:00:00 UTC
From: Paul Matthews <paul_matthews@yahoo.com>
Message-ID: <7u45te$8ab$1@nnrp1.deja.com>
Source record: 72053

Hi All

Further to my last mail (thank you to everyone that responded!) I have a few more questions.

I have had a look at my TT RAM board and it is populated with SIPPS (pain) are there any TT Ram boards still available preferably in the UK? If you have one for sale please let me know!

Do any jumpers or switches need to be set to use an external high density drive as B?

I have looked at my TT under Profile 2.2 and it identifies my TOS as version 3.0 is that correct? I was under the impression that there were TOS versions 3.1 - 3.6.

I wish to install MagiC 6, NVDI 5, Cab 2.5, HDD Driver 7, Kobold 2.5 etc. What is the best way set these apps up? How do you set yours up? What is the best replacement desktop?

I am confused with Cab what is the thing with all the overlays? I am using 2.5 what clients can I use with it i.e. news and mail etc?

Sorry to ask so many questions there are lots more and thank you in advance for any ideas suggestions etc.

Paul

I hate to rush to the defence of a Microsoft product, but fairness
dictates I must. I have never seen an instance where Outlook Express
doesn't follow the correct syntactic rules for MIME attachments.

>Is this the fault of Okami? Who knows. It can also be a problem of
>Outlook Express.

Any MIME multipart message that isn't composed correctly, will still
be imported by Okami.

Regarding HDDRIVER the setup depends on your peripherals. You should
consult the HDDRIVER manual for a description of the available options.

| . . . .

Jacked up the serial port speed to 115200 and CAB is now downloading at around 4000. Perhaps I should also point out that I am using a new zetnet number and perhaps this why things have improved so much. At present I would say that STinG is better than STiK but against it is the fact that I have tried hard three times to get it to work without success and it was only that someone sent me his scripts I would probably have failed this time also. Thanks Jim.

Sounds as though you have Magic installed as this identifies TOS as v3.0. I bet you have v3.06. Boot up without Magic and try again.

The only time this causes bother is with the Cranach graphics program which gets confused if it receives a TOS value on a TT which is not GREATER than 30.

> I wish to install MagiC 6, NVDI 5, Cab 2.5, HDD Driver 7, Kobold 2.5
> etc. What is the best way set these apps up? How do you set yours up?

Use a boot manager such as X-Boot so that you can choose how to configure your machine. You may want:

plain TOS
Magic
Magic+NVDI

as distinct options.

There's no real bother with the rest - you will use HDD ALL the time, the others are just normal APPs.

> What is the best replacement desktop?

Personally I have never needed to use other than the small and efficient Magic Desk. Of the others Thing is cheap and has a good reputation. Jinnee looks good but you will be at the mercy of ASH distribution policies.

> I am confused with Cab what is the thing with all the overlays? I am
> using 2.5 what clients can I use with it i.e. news and mail etc?

If you are using I-Connect as the TCP/IP stack you can ONLY use the .OVL supplied with the package.
If you use STiNG or STiK you can use either Dan Ackermann's or Olivier Booklage's .OVL. I'm not sure of the current state of play. They are both very similar but tend to lag/lead on the support of HTML features.

CAB IS a client itself (of whatever TCP/IP you have installed). Again your choice of mail, ftp, IRC etc. clients may depend on the stack you are using. There tends to be 2 groups:

stuff from ASH which use the I-Connect stack ..... and ...
share/freeware stuff which use STiNG/STiK

I have always stuck with the second group - there's enough variety for anyone.

Roger

Now I'm paranoid enough without this kind of "humour".

Presumably this is a joke, but does anyone else have any knowledge of
this? Even better, would the Prof. himself like to let me know why he
decided to threaten me in this quite possibly illegal way.

Okay maybe I have listened to one too many depressing goth CDs and my
sense of humour has as a result evaporated, but I am _not_ impressed.

I'd appreciate some comments on this...

Best wishes,

Ash

If you have a bog-standard ST you probably won't get much higher speeds from that modem, unless you install a serial port speeder (there are a few designs around on the 'net, or System Solutions sell a good one).

Since Bengy seems to have stopped updating MagiC Online, what is to happen with this competition?

I'm especially keen to see Mario's Asteroids at last! :-)

BTW, watch out for an announcement regarding a new download site for the translations that were previously available from that site.

This is disc image format used by Pacifist. To convert it back to "normal"
form you need ST2DISK program. It should be on most web sites with .ST files.

It's also possible to put dialer.app into your CAB modules folder. Possibly not as convenient as using it as an acc, but better than the other solution.

It's not a great difficulty having it assigned to a function key - no
more difficult than using it as an accessory.

I am uncertain what the benefit is of putting it in the CAB modules
folder (as opposed to the STinG folder where I have it at present).
If CAB is launched will the dialer start up automatically?

Hades. I have HSModem 7 and set Modem 2 to 115200 (correction I had
set it to 115200 - I just checked it now and it was re-set to 57600
- it has happened before that a program has reset the speed).

The download speeds are really marvellous.

Do the hardware serial port modifications still need HSModem?

I've been following this thread, and I'm a bit baffled as well.
Between my sons' STe and an older 1040ST I've got, there is not
much that won't run on both machines. Different TOS versions,
and a few STe specific demos/games seem to be about it. (that
won't run) IF the original poster could list specific software,
we could help him a lot more...

Later... ;-)

Atari 1040 STe w/ SM-147 monitor and 2 mice. Original Cubase 3.1 software included. This is an official Steinberg version that is still unregistered! Crossgrades to PC or Mac VST versions are still available! It comes w/the hardware key, all program and module disks, and a thick manual in the original box. As a bonus I will throw in a ESQ-1 editor, a sysex patch librarian and any Atari software I have lying around. This is a great MIDI sequencing package for a good price. NO CODs. NO Trades. Prepay ONLY. $250 and I pay shipping in the US. Don't pass this up! Need to sell ASAP!

Wrong, here on my Hades using freeMiNT 1.15.4b/N_AES 1.2.0/Thing 1.27, UVK
works nice and smoothly, even with the 'copy back' cache on.

This is disc image format used by Pacifist. To convert it back to "normal"
form you need ST2DISK program. It should be on most web sites with .ST files.

Grateful thanks for the reply ,nice to hear from an Atarian
in POLAND. Many others have also given me the info but thanks
again for your help as well.

> 1. Which TOS version should I use?

It doesn't really matter - why not go for V2.06? This is a good, stable
version.

> 2. How do I read TOS from the Gemulator? Do I have to put it on a
> floppy or on C:\?

In theory you just stick it on C:\ and tell Gemulator "First Time Set-Up" to
search the hard disc for the O/S.

However ..... I have been having enormous problems with this technique. The
docs. for the free version of Gemulator tell you that v2.06 should be
re-named to MAGIC_PC.OS. Well, this sometimes works, sometimes it doesn't.
You may need to re-set things by deleting the Gem98.ini file in C:\Windows.
I have attempted to load Gemulator v5 with TOS 2.06, Magic v5.11 and the
Magic which comes with the MagicPC demo. Gemulator (according to the docs)
is supposed to Search for and remember all of these from the HD so that yoou
can choose how to initialise Gemulator. Well, I have tried everything .....
it will NEVER find more than one of these O/S and, if you put a foot wrong,
it will often find NONE of them. This is no way to promote a product!

When I then run the emulation I get a screen of vertical bars (with
Magic_PC.OS) or a wierd wallpaper pattern (with TOS v2.06). The on-line docs
say that there have been troubles with the ATI graphics card (which I am
using) but these are circumvented by using the latest drivers or by setting
the colour resolution to 16-bit.

I have tried both of these but get absolutely NO satisfaction.

I wish you luck with Gemulator but, as far as I am concerned, it's a
non-working program!

Hi all,

Today I updated the Atari Icon Library with 5 new archives, so now you will find no less than 34 archives with all sorts of desktop colour icons. Drop in and have a look at the new additions!

http://gokmase.atari.org

I also want to take this oppotunity to thank everybody that in any way has contributed to the library, with donations, advise, encouragement or whatever. It seems like quite a lot of Atari users have stopped by and downloaded some icons. That's great! :)

I will keep improving the collection as long as I get new icons and feedback!

Best regards,

Joakim

Hi,
I've used HDDriver with CAF for years without any problems.
Use the default setup, but reduce the cache settings to minimum (I
believe the min setting is 2 for both cache settings). Also set the
SCSI-disk's internal cache to read-only - it'll work anyway, but I feel
it's safer that way.
BTW - does the demo version recognise more than the C: partition? I seem
to remember there's a limitation in the demo...?

You have to return your disk to Titan for an update. The update is encripted, and registration is required on the users floppy before the applicaton can be used. It is a very complicated process, and likely will take a while to get your disk back.

Hades eh? That's a tad out of my league! :-)

Odd that the serial port gets changed - I'd assume that the speed set in the config section of comms progs would "stick", or if there isn't a choice the one set in serial.cpx. Perhaps that's where the problem lies.

>The download speeds are really marvellous.

As with everything else on the Hades I'm told, nice machine.

>Do the hardware serial port modifications still need HSModem?

On the ST, yes. The commercial variant uses the baud rate redirection facility of HSModem to switch the speeder for progs which don't know about port speeds over 19200 IIRC.

Falcon 030 80meg hd / 16meg ram, manuals, disks, box, beetle mouse, vga, and
atari display blocks
Cubase Audio Falcon with dongle, manuals, box
FDI Digital interface
FA 8 D/A converter
Steinberg Atari-Midi 3 interface (gives extra 3 midi outs)
2 gig scsi a/v drive.
software:
Crawly Crypt cd
Ultimate Cubase cd
Atari Compendium cd
Diamond Edge

The only thing that needs to be added is HD Driver to properly format the
disk.

I am located in USA

Have about 3 grand invested here.
Offers?
What is a fair price?

BTW...This set-up sounds great.

Please email response to
pedersen@pclink.com

ok ... i have the following for sale ... they probably don't work anymore, but they look cool

ST DMA TEST FIXTURE C103589-001 REV.A

MEGA ST EXPANSION PORT TEST FIXTURE C100295 REV.1

PBI TESTER CA026033-001 REV - (left blank) one chip has sticker that says 130XE

CPS SUPERSALT DIAGNOSTIC CARTRIDGE FD100335 REV. 01

Another SALT cartridge marked SALT Version 2.0? (the last digit was worn off)

(don't even know if this thing goes to an atari) interface that looks like a Commadore cartridge with a wire harness coming out from its top, the wire harness has two connectors that look like they would plug into joy stick ports, a card edge connector that is 6 connectors wide with 10 of them wired, and a round 6 pin connector (sort of like an AT keyboard connector) with only two wires attached

i would like to sell them as a lot, best offer + shipping

dan_boese@und.nodak.edu

838. Pagestream deskjet driver, HERE

Those who want a Deskjet driver for Pagestream are welcome to try:
www.emrl.com/~alexf/deskjet.prt

And if you don't already have a printer accelerator try:
www.emrl.com/~alexf/fpprnt.prg
I think you can run it anytime, but I know it works from the AUTO folder

839. Re: Pagestream deskjet driver, HERE

Source record: 71989

Hi!

K>pexec() was
K>explained, detailed in books, references and quite established by atari
K>corp, and the open src is totally viewable by anyone to respect the
K>behavior of this call.

Yes, but my question was different. Just because you can browse through the Kernel src doesn't mean that the Magic author always has to search the src for new functions he has to implement into MagiC. As you said pexec() is well explained and documentated so this is a different case and MagiC now also supports pexec().

K>Now how to explain that to a user that the prog
K>doesn't work right because of internal differences between OS? who to
K>blame? I don't know...

Instead of blaming someone we should probably just hope that both OS continue the way they are going right now. N.AES supporting MagiC objects and MagiC supporting the other side as well.

K>but the fileselectors do work as
K>expected. (don't take it literally this is just an example).

Yes, and the two OSs don't at the moment but they are going into the right direction. They are already quite compatible and

JFD>(hopefully soon more :-)) compatible with each other

to quote myself.

K>done on purpose? well there is a big
K>statement here, you are responsible to what you say, "basically, I come
K>forward, next to you, knock you really hard in the face in the nose,
K>you bleed, and then I would be, oh man, I didn't mean that, I am
K>sorry" (meanwhile, hiding my smile) Oh well...

So people who advertised OLGA to be MagiC only where hiding their smile when they said 'oh man, we didn't mean that, of course it works with MiNT/N.AES'? I don't think so.

K>So we have 2 clans then?
K>super install for weak software and LAME install for super software. I
K>guess that sums up the situation pretty well.

Nope, when I'm able install a weak software easily I can also see that it is weak and can kick it into the dustbin. When I'm not able to install a super software I can't see that it is super and then I'll kick it into the dustbin as

well.

K>And learning to play the piano within minutes, otherwise piano sucks coz
K>you couldn't play a concerto.

Bad example. When you want to render some masterpieces you have to learn what to do to get the output from your rendering program but the OS is just the basis for running this programm. You don't want to bug arround with installing that stuff and installing the rendering package. When you buy a piano you won't get just the parts and then you have to build the piano first before you can start playing.

K>Computers are made for more efficient work,
K>people don't want to deal with them. Fine, I guess that's why people
K>used GEM with atari at the first place instead of DOS pc in the early days.

Exactly.

K>GEM singletos is still there, you still can use it, you just need to
K>deal with its weaknesses. Don't expect it to embed documents across
K>applications, while spellchecking another document in background while
K>playing mp3 and converting a mov into a flc file.

Yes, but I think that new developments don't have to be more complicated than the old stuff.

K>Hell can't even release at least 10 programs I have done, along with some
K>converters and scripts coz they will not run on anything else than a
K>"similar" setup as mine.

That's a point. What programs are these?

K>What else did he have to pay attention to? the mainengine directly came
K>from ruftrade. The goal was to make this GEM happy. It all failed
K>miserably if you ask me.

So the GEM interface sucks under N.AES? It looked quite OK using MagiC and when the author relied on MagiC objects then it will look OK with the next N.AES release.

K>you forget something here, there is no way it could get marketed,

It could get marketed if e.g. woller likes to include MiNTNet as the standard TCP/IP stack for N.AES.

K>as it is free. The "people" you are talking about do not want linux, yet,
K>linux is a very successful OS as of today.

About what people am I talking? In most cases I'm talking about myself. If I have to spend nights installing software I am happy when it is done but I would have been more happy when some sort of installer does the main part for me and automatically avoids newbie faults.

K>Well, "support" is quite a strong word that should not be used in this
K>case. I believe you wanted to use another word as it is totally

K>inaccurate.

Nope, I think support was the right word. I don't know what type of support the distributors of ASH products give you but here in Germany you can call a hotline, you can call the ASH mailbox which has updates and discussion groups for each product and you can email the people behind ASH directly. And you still get that type of support for CAB as well.

K>Not answering the question at all.

Right, I don't know how many have AV server setups. But we probably 'just' have to count the number of Thing and jinnee users.

Regards,
Jan

I hope you don't mind me commenting on this... :-)

We haven't spoken before, and I do come in peace, so please don't kill me.

>> > KE>Can anyone tell me why is gemtrade so crappy?

In what way? Which version?

>> What type of example should this be? It is crappy because the author only paid >> attention to the GUI?

Did I?

> The mainengine directly came
> from ruftrade.

Really?! That's news to me - have you debugged both programs? The dictionary is only the only part that is the same. The old Ruftrade engine was poor at preserving layout and didn't support HTML, ie. it translated the tags. GT doesn't have these problems.

> The goal was to make this GEM happy.

One of the goals was that, yes. There were others though.

> It all failed
> miserably if you ask me.

Remind me not to!

Still, in the Atari spirit, I'd really like your facts and not your opinion on where the failures are - perhaps they can be resolved? I am open to suggestions of the constructive nature.

I don't mean to sound rude, but you seem to be taking a very knowledgeable stance WRT GEMTrade.... You make all these comments about what *I* did - yet you've never spoken to me - there are factual errors here - and I bet you are not even using the latest version!!!

I know this has happened before, ie. you criticising GT based on your opinion rather than anything specific. A friend who is working really hard on the French version of GEMTrade asked if it was personal!!! :-) Is it?

Mark.

I missed the start of this thread but it looks like you are trying to download Olivier's CAB.OVL. I had great difficulty getting to the site even after mailing Olivier who sent me more than one suggestion of URL's that would find it.

In the end I gave up and used my son's PC - guess what, I found it straight away ! Then, once I started to use it I could get to the site without any problems using CAB again.

Maybe this is what you will have to do.

Cheers

Paul

P.S. If you are still having problems let me know and I will send it to you direct.

You too huh? Ive got TOS-images for 1.00, 2.06, SUPER and KAOS -
gemulator refuses to find any of them. In fact, if you tell it to go and
look nothing happens

> The
> docs. for the free version of Gemulator tell you that v2.06 should be
> re-named to MAGIC_PC.OS. Well, this sometimes works, sometimes it doesn't.

I didnt see this - All my files are still *.IMGes should I rename them?
The documentation appears to claim that you need Magic to rum gemulator
- anyone know if this is true?

> You may need to re-set things by deleting the Gem98.ini file in C:\Windows.

OK, ill try this - you should be able to manually define where this TOS
images are though - any idea how?

> I have attempted to load Gemulator v5 with TOS 2.06, Magic v5.11 and the
> Magic which comes with the MagicPC demo. Gemulator (according to the docs)
> is supposed to Search for and remember all of these from the HD so that yoou
> can choose how to initialise Gemulator. Well, I have tried everything .....
> it will NEVER find more than one of these O/S and, if you put a foot wrong,
> it will often find NONE of them. This is no way to promote a product!

Like I say, my copy (Im using the free ï¿½98 version on W95) doesnt even
try ro look for the files, you click on "search hard disk and nothing
happens. Gemulator itself will then only allow 800XL emulation to be
used.

854. New Atari hardware and software

Newsgroup: comp.sys.atari.st
Date: 1999-10-18 00:00:00 UTC
From: mb@gem.win.co.nz
Message-ID: <FJsGxG.Do@gem.win.co.nz>
Source record: 72002

Well it looks like my previous article did get to the usenet. Several times in fact, sorry. But I know posting is working now.

So here is a brief history of the Atari software and hardware I have been working on during the past year. You can read more about this on my WWW page at http://gem.win.co.nz/ .

My newest product only just announced is QWERTYX

The Ultimate PC AT keyboard and serial mouse interface combined for Atari computers. It enables PC AT keyboards and serial mice to be attached to Atari STFM, STE, Mega, TT, Falcon and compatible computers.

There are many special features available such as a user-configurable keyboard map (those windows keys can be mapped to something useful for example); automatic control, alternate or shift key macros on a single key; operation of mouse and joystick using the arrow keys (with much better control than the standard alt+arrow keys approach) and many more.

SERIAL MOUSE INTERFACE

Which was, I believe, available before I disappeared from the usenet, is still there and has been selling quite well.

IDE HARD DISC INTERFACE

For ST(FM) and STE computers was released around the end of last year. If I remember correctly I was never able to announce this on the usenet. This interface enables IDE devices such as hard disc and CD-ROM drives to be attached to Atari ST(FM), STE and Mega ST computers. It mounts inside the machine so that you don't need any external boxes containing the hard disc drive. Supports 2.5" drives as well as standard 3.5" and 5.25" models.

THE VGA MONITOR ADAPTER

This was released earlier in the year and enables a VGA monitor to be attached to an Atari ST(FM), STE or Mega in place of an Atari high resolution monitor.

SOFTWARE

Apart from the Currency Converter, Text Analyser and other programs that were already available last year, I have lately been working on several GEM games that were to be released at the end of this year in coordination with the Magic GEM game competition. You can read about one of these (Asteroids) on my WWW site, the rest are not publicised yet.

NEW INTERNET ADDRESSES

As I mentioned in my previous article, our email addresses and WWW page URLs have changed. The old ones will continue to work for a few weeks but you should really use the new ones which are as follows:

EMAIL ADDRESS: mb@gem.win.co.nz

WWW PAGE URL: http://gem.win.co.nz/

Also Brian Becroft's email address will now be: brian@gem.win.co.nz

Tariland Computer Club email address is now: info@tariland.win.co.nz

SO there you have it. Please contact me at the above addresses if you have any enquiries about anything above.

Glad to be back, and wishing everyone all the best,

: Sorry, I have to correct myself: ST-Computer mentioned Asteroids a
: while ago in the news so I thought it was already available.

On my WWW site for a few months was a message saying that Asteroids was to be released any time. It wasn't. I am now working on it again and will be releasing it towards the end of the year with any luck (along with a couple of other GEM games that have not been announced yet.)

858. Keyboard Problems with 1040STE

Newsgroup: comp.sys.atari.st
Date: 1999-10-18 00:00:00 UTC
From: azimuth32@hotmail.com
Message-ID: <MPG.1275a854f36e0887989692@news.zip.com.au>
Source record: 72006

Hi all,

I have just recently developed a keyboard problem with my 1040STE.
For some strange reason I get no response from the entire left side of
the keyboard.
e.g
I get no response on the monitor from keys q, w, e, r, t, & y.
Yet u, i, o, p, [, &] work. Also the shift, tab & control keys don't
work.
Anyway my problem is that I use a programme called Notator and this
problem completely renders the software useless.
Does anyone in Sydney Australia know of a repair place that could fix
this for me?

Thanks in advance.

859. Which Desktop?

Newsgroup: comp.sys.atari.st
Date: 1999-10-18 00:00:00 UTC
From: Stephen Moss <sgm23@eng.cam.ac.uk>
Message-ID: <7uf2d9$9ec$1@pegasus.csx.cam.ac.uk>
Source record: 72007

After many years of using an ST (TOS 1.02) I finally got around to buying a hard drive which is now leading me consider using a replacenet desktop so that I can place the program fles on the desktop as opposed to having go through various drives and windows to find the program file.
Having read a review comparing Ease, Neodesk and Thing I had decided upon Neodesk, but now I also have a Falcon (TOS 4.04) and I need to consider both machines.
As most of my software probably won't multi-task due to the fact that it was written pre Falcon it does not need to be Magic C compatable as I probably wont be using Magic C.

So which is the best of these desktops and how do they compair to what I assume is the relative new comer of System Solutions Jinnee.

Thanks,
Stephen Moss

lproven@hotmail.com (Liam G. H. Proven) wrote:

> However, we need to know more about the Atari versions to find out
> where we're aiming!

OK, here's what I have so far. Comments, please?

Historical versions
==========

OS: TOS
Vendor: Atari
Version: 1.00
Machine(s): 260ST, 520ST
Comments: Initial release. Fairly buggy; only used for compatibility with
older programs.

OS: TOS
Vendor: Atari
Version: 1.02
Machine(s): 520ST
Comments: **?**

OS: TOS
Vendor: Atari
Version: 1.2
Machine(s): Mega ST
Comments: Some bug fixes; support for DMA/Blitter chip

OS: TOS
Vendor: Atari
Version: 1.4
Machine(s): 520ST / 1040ST
Comments: Most common version of TOS. Most compatible with games.
Primarily bug fixes.

OS: TOS
Vendor: Atari
Version: 1.6/1.62
Machine(s): 1040 STE
Comments: Support for the enhanced STe. More colors, etc...

OS: TOS
Vendor: Atari
Version: 2.05/2.06
Machine(s): MegaSTE

Comments: Last version of Atari TOS for the 68000 line. Desktop
gains defineable keyboard shortcuts. Many bug fixes. Friendliest and
stablest version, but loses compatibility by fixing bugs and changing
undocumented features from v1.4 that older programs expect and use.
Preferred choice for serious ST use.

OS: TOS
Vendor: Atari
Version: 3.05/3.06
Machine(s): TT
Comments: Similar to 2.0x but adapted for 68030 machines

OS: TOS
Vendor: Atari
Version: 4.0x
Machine(s): Falcon
Comments: All-new version for the Falcon. DSP support, 68030 only.
Colourful desktop, but still comfortable to those used to the 2.0x or 3.0x
desktops.

OS: TOS
Vendor: none (developed by Atari)
Version: 4.98
Machine(s): Never officially released; distribution illegal
Comments: Bug-ridden internal developer version, but sometimes
offered for download.

OS component: MiNT [MiNT is Not (later, "Now") TOS]
Vendor: Atari
Version: **???**
Machine(s): ?
Comments: Unix-like preemptive multitasking/multiuser kernel
originally developed by Eric Smith. Provides process/memory management,
filesystem I/O etc. Replaces GEMDOS; requires AES, VDI and desktop.

OS: MultiTOS
Vendor: Atari
Version: **???**
Machine(s): ?
Comments: Official Atari version. MiNT kernel + (very slow)
multitasking v4.1 AES.

Current versions; under active development
==

OS: TOS
Vendor: Milan Computer GmbH
Version: 4.5
Machine(s): Milan
Comments: Debugged version of Atari TOS supplied with Milan
ST-compatibles
Website: http://www.milan-computer.de/

OS component: FreeMiNT
Version: currently 1.15.4 beta
Vendor: Free GPL software
Machine(s): ?
Comments: Open source version of MiNT, released by Atari after
withdrawal from ST market
Website: http://www.cs.uni-magdeburg.de/~fnaumann/mint/

OS component: N.AES
Version: currently 2.0
Vendor: Woller Systeme
Machine(s): ?
Comments: Commercial replacement for Atari v4.1AES. Runs on MiNT.
Currently most useful AES for MiNT.
Website: http://www.woller.com/

OS component: NVDI
Version: 5.0
Vendor: Behne & Behne Systemsoftware GbR
Machine(s): ?
Comments: Replacement VDI (cf. N.AES). Commercial. Works with MiNT,
MagiC, TOS. Much faster and provides TrueType and Speedo font support.
Commonly used for professional ST work.
Website: http://www.nvdi.de/

OS component: oAESis
Version: **???***
Vendor: Free GPL software
Machine(s): ?
Comments: Unfinished project to create a free AES for FreeMiNT.
Website: http://www.nocrew.org/osis/oaesis/

OS: MultiOS
Version: currently 1.2
Vendor: Milan Computer
Comments: Bundle comprising FreeMiNT kernel, N.AES and N.Thing
desktop. (**what VDI?**)
Website: http://www.milan-computer.de/

OS: MagiC
Version: currently 6.1
Vendor: Application Systems Heidelberg
Machine(s): ?
Comments: Commercial TOS-compatible reverse-engineered replacement
OS for ST/TT/Falcon & compatibles.
Website: http://www.application-systems.de/magic/

>working with half of both original capacity...

No, that won't work because you can't format the cartridge single-sided.
The tracks are written and read in turn on both sides - first track 1
side 0 then track 1 side 1 then track 2 side 0.... With one damaged
head, you won't be able to write or read every other track! At least
that's what I have been told.

So .. it's not me being stupid, after all :-)

> > The
> > docs. for the free version of Gemulator tell you that v2.06 should be
> > re-named to MAGIC_PC.OS. Well, this sometimes works, sometimes it
doesn't.
>
> I didnt see this - All my files are still *.IMGes should I rename them?

I have looked in the .EXE file and found that there are 3 search strings:
C:\TOS.IMG
C:\MAGIC_PC.OS
C:\MAGIC.RAM

Darek's README says that small (192K) TOS file should be named TOS.IMG.
Larger (256K) TOS, e.g v2.06, and the TOS which comes with the Magic_PC
demo should be re-named MAGIC_PC.OS. The TOS files which come with ST Magic
should be left as they are, MAGIC.RAM.

Mind you ... the only one which I can "Search" and find with no trouble
seems to be the Magic_PC.os which I filched from the Magic_PC demo.

Ditch gem98.ini before you start any new experiments as this can compromise
your efforts!

> The documentation appears to claim that you need Magic to rum gemulator
> - anyone know if this is true?

No, I think it claims to run a whole bunch of TOS, KAOS, MAGIC.

> OK, ill try this - you should be able to manually define where this TOS
> images are though - any idea how?

Yes. Once you have managed to search and find ONE image file (for me this is
always the Magic_PC.os) you can go to the re-written gem98.ini where you
will find the search string for the image file. The .ini file is binary but
I have found I can edit the search string which will then allow me to load a
different image file. Make sure the string you substitute is terminated by
$00.

> Like I say, my copy (Im using the free ï¿½98 version on W95)

... I'm using this, too, but on W98 SE.

With these few hints you ought to be able to get some sort of image loaded.
I shall be interested in the result as I am still at the stage where I get
garbage displayed in the emulated screen. Pshaw!

Roger

Nice to know the overlay has that much of an
improvement. But why is it that some websites
simply don't appear to one web browser with fewer
abilities than another?

Is it in the coding of the website?

Source record: 72017

Wow.. the more I hear about TT ram the more
I realize I have not seen true TT speed. I saw
an article in an old Toad Computing catalog that
claimed that TT ram could make a speed increase
of up to 300% with some applications. Now this
is more like it!

So my only questions when it comes to speed
would be as far as Pagestream and CAB go. Those
are the only applications that need speed. Ah
yes, that, and graphics programs.

I guess a good question to ask is, what
programs DON'T work under TT ram?

Glad to hear that Spectre works with TT ram.
Perhaps you can answer me this question. I've
heard that Spectre can work with system 7. Have
you had any luck getting System 7 to work yet?
If it is TRULY Macintosh Plus emulation, System
7.5.5. should be possible so long as you have at
least 4 megs available.

Good to see you back Mario!

Actually 1.02 and 1.2 are the same: Atari changed the numbering scheme for
some reason best known to themselves so 1.2 became 1.02 and 1.4 became 1.04.
However just to add to the confusion 1.6/1.62 didn't change, to the best of
my knowledge.

AFAIK 1.2/1.02 was available in 520s, 1040s and the Megas.

You may be thinking of Datalite 2. I used the program years ago and it
seemed to be reliable and fast enough (on a TT, I don't know what it would
be like on an ST). Unfortunately it didn't work with other not FAT
filesystems under MiNT. Since then I no longer have a lack of hard disc
space so I have never tried to use it again.

The best thing you could do is simply buy a larger hard disc drive.

>programs DON'T work under TT ram?
>

That's two questions :-):
Q1. If I install TT RAM, what programs won't work?
A1. None, since programs won't _use_ TT RAM unless:
a) they specifically ask for it (in which case I assume
they are able to handle it ...), or
b) you set flag(s) in the program's header (with a utility
such as PRGFLAGS) that says memory requests may be
satisfied from TT RAM.
Q2. If I have TT RAM, and set the program flags to use it, what
programs will probably crash & burn?
A2. Any program that expects to do ST DMA into memory. This
could include drivers, audio players, etc (although of
course many of them written or updated since the TT came
out will handle things properly).

If anyone can produce the circuit diagram on this thing then I'll have a look at makiong some, ditto some TT-RAM boards....I'd have to get a club of people willing to deposit with a trusted third part of some description so that the production costs of the PCB could be covered, and I prolly wouldn't do it as an ASP thing, just on the side....there aren't enough TT users in this country to make it worthwhile (I live to be corrected on that)...I'm getting a TT soon so I'll want them myself too....10Mb ST-RAM (2+8) and 32Mb of TT-RAM would be nice....especially as I can get 4Mb 30-pin SIMM's really cgheap from work....also working ona technique to re-chip 4Mb Falcon boards to 14Mb...

Hi!

I know a PCB designer, he and I have done PCB work before. We would need the circuit diagram, and the information on the TT bus, and it's physical diagrams.

Also, prototype boards can be made, it all depends on the cost and amount. Plated Through Hole PCBs would be preferred. If going with an actual PCB house, you have to pay for tooling/setup.

I think 1.02 came with the early Megas but did not support the
blitter - would that be right? I am fairly certain that as well as
getting the blitter chip after I bought the Mega I had to upgrade
from 1.02 to 1.04.

I have to agree with John here, I think 30% is a more realistic
number and that is at max conditions. Assuming the task the machine
is performing fits entirely in the cpu caches and burst mode is
enabled. Getting a card with burst mode is a challenge also
since the original ATari boards were very picky about the
simms. A third party board is almost require to get burst mode.

Hi,

is there anyone interested to get into contact with the author of
OPTIMIZE?

There was one "Derryck" who translated the resource into English.
Maybe he?

Let me know if someone wants to write to Hans-Peter who finally has
access to the net (again).

I'm a bit sad for he wrote me that his engagement towards Atari
software has become very very low. He purchased a fast PC _without_
Windows, for he did never like it. He runs just Linux and BeOS.

Regards, Peter

Source record: 72042

Hi all :

I just discovered the weirdest and most convenient "feature" on the Falcon!
If I record and audio file in Logic Audio (Sound Designer II file) at 49170
kHz the info on file will say that the audio file is 49170 kHZ . Then if
I ounload the file and reload it the info on this file will say that it is 44.1!!!!

I tested this many time and imported the file to many d2d programs and sample
editors. I have no idea how this works ? I have just a plain Falcon with no extra clock
etc.
This is extremelly convenient as the files are ready to make a CD at 44.1
and I do not have to transpose them from 49 kHz to 44.1 which would be 200 cents or a whole
step!

I am surpriced but happy to find this. Usually the Falcon needs an external clock to do
44.1

Any ideas as to why this works this way?

Thanks, Raymond

Source record: 72043

The answer to this question is found on the System Solutions web page ad
for the CenTurbo II. They compare the speed of the CenTurbo II to a
stock TT using NemBench, which shows speed of ST RAM and TT RAM. This
information is also reproduced in my Atari Computing 14 article
comparing the Nemesis, FX, and CenTurbo II boards.

Source record: 71845

Hi!

Johan Klockars <rand@cd.chalmers.se> wrote:
> The list for the stable tick counts should be:

> [...]

If the calculation of the ticks hasn't been changed in the port, the
table should indeed look like this:

Dots fps
0 ~ 70.00
1 ~ 35.00
2 ~ 23.33
3 ~ 17.50
4 ~ 14.00
5 ~ 11.67
6 ~ 10.00
7 ~ 8.75

Quote from the Doom FAQ:

-- snip --
[9-2-1]: What do the dots that appear in development mode mean?

Direct from id, the final formula for calculating the frame rate that
the dots represent has been determined. The formula to convert dots to
frames per second is:

70

<NUMBER OF DOTS> + 1
-- snap --

Note, though, that 70 Hz is the usual refresh rate a PC has in 320x240,
and it seems that one should replace the 70 in the above formula with
the screen refresh rate of your video mode (in case the port
synchronizes its output with it, which would make sense).

Well, I must admit one might get the impression I gave up on Thing. I
can assure you, though, that this isn't true, but I currently have
little time and also gave hacking some stuff into MiNT priority in the
last months (Atari-wise, this isn't the reason for having little time).

I know that it will *work* with WDialog, but honestly it's not really good
unless you're using MagiC 5 or 6. It's pretty obvious that the RSC is
designed with MagiC in mind, and some dialogs will not show up correctly
under TOS or N.AES (1.2.0) even with WDialog. It's OK with Geneva though.

| . . . .

I think that's right. The blitter option only showed once the
blitter was installed. The upgrade to 1.04 was to do with better
hard-drive performance I think.

As the topic says, I am looking for all the early issues of ST Plus diskmag
to add to my collection.

Once I have them all I'll burn them onto a CD for future reference, as I
don't trust floppy disks anymore :P

Kev.

Source record: 71854

Still trying to get online with I-Connect/CAB 2.5 on my Falcon030 (Magic5). The login is working fine, but when it gets to "Negotiating PPP Connection" it stalls. An Error pops up that mentions "Timeout during Configuration". I think it has to do with the way my Auto Folder is set up. Should I be using HSModem, cause I thought I-Connect replaced that with it own drivers? Anyone using I-Connect tell me what the Auto Folder should look like or give me advice on what could be wrong (could it be my ISP)? Please help an novice Atarian.

thanks, lewis

P.S. Sorry about the previous post. I don't know what happened.

I'll second that. If you are planning on sticking to single TOS and don't need all the multitasking doodads it's very good indeed. I used it for years very happily.

The last version of it would also work as a multitasking desktop, but it doesn't do long filenames, AVserver etc.

Hi Peter.

X>No, that won't work because you can't format the cartridge single-sided.
that's true for floppies, but are you sure it's right for SQ
cartridges?

X>With one damaged head, you won't be able to write or read every other
X>track!
Ok, supposed you're right, please explain me the following:

After an awful noise of his drive, a friend of mine had only 22 megs
on his cartridge.

A second friend could read (and format), but not write on his
cartridge. Astonishing, isn't it?

So we took the electronics from friend1's drive which we thought to be
intact (we thought one of his two heads had crashed) and put it onto
the drive of friend2 (whose heads we thought to be intact).

And what happened?

The drive works and has been working since (a couple of years)... :-)

If I'm wrong, I don't understand how we made one intact drive from these two damaged ones.

Regards, Peter

Hi Doc,

DC>I saw an article in an old Toad Computing catalog that claimed that TT
DC>ram could make a speed increase of up to 300% with some applications.
that depends on the reference!

If you compare a TT to a Hades or Milan, you will forget it at once!

DC>I guess a good question to ask is, what programs DON'T work under TT
DC>ram?
DC>
Most of them do. E.g., CALAMUS (1.09N) won't do.

There is a small program called PRGFLAGS that allows you to set three
flags:

(1) Fastload flag
(2) Run in TT RAM
(3) Use TT RAM

Best thing is to try, and if one soft won't be able to run and/or use
TT RAM, your desktop will be bombed... :-))

Regards, Peter

I doubt if this is true, in fact it is the other way around. You must set flags
to prevent programs from using TT ram. See my little story above.

TOS 3.06 automaticly redirects DMA transfers to a buffer in ST ram, after that it is
moved to the TT ram specified in the GEMDOS call.

Quite right the Gemtrade GUI is a bit quirky, even under MagiC, but if I'm
that annoyed by it I'll spend an hour or so with ResourceMaster and 'adjust'
it to my liking! Of course I wouldn't distribute an altered RSC...point is
that if GEMtrade uses MagiC objects then surely the RSC can be changed to
use generic AES 4.x, interface or whatever, without affecting the operation
of the program, which IMHO is fine for personal use?...

Kind regards,

Chris Wilkinson, Christchurch, New Zealand.

> Did I?

If its any consolation Mark, I think GEMtrade is fine!! The GEM GUI is a
little quirky perhaps, but the program does what it sets out to do for me,
and that is help me further my understanding of german docs, because BOY
do I need help with that at times! :)

PS. I hope you don't mind me playing with the RSC file? I kinda like
'altering' things to look how I like them!! I'd NEVER distribute an
'amended' RSC (unless the author like it!)...

Kind regards,

Chris Wilkinson, Christchurch, New Zealand.

Atari 1040 STE computer in excellent condition.
Comes w/ Cubase 3.1 (in original box, w/dongle, manual, all disks) I have not registered this copy so a crossgrade to Mac or PC VST is still available from Steinberg. All items in excellent condition and work flawlessly. Comes w/SM-147 monitor, 2 mice, an ST dustcover, an ESQ-1 editor, a patch librarian, a couple of books, and other software in original boxes. This is a great deal on the most reliable MIDI only setup. Need to sell ASAP! I won't consider trades or do COD. Prepay ONLY. $250 includes shipping in the US!

I can assure you that programs won't use TT RAM unless they have their
program flags set to allow it (or if they use the Mxalloc() GEMDOS
call which was added for TOS v3.xx). Of course, many programs are
distributed with the flags correctly set already.

Specifically, the flags are at offset 0x16 in the program header and
the bits in question are as follows:
bit 1: if set, the program MAY be loaded into alternate RAM (AKA TT
RAM); if clear, the program MUST be loaded into standard RAM
(aka ST RAM)
bit 2: if set, the program's Malloc() requests MAY be satisfied from
alternate RAM; if clear, the program's Malloc() requests MUST
be satisfied from standard RAM

I was speaking generically, for programs that deal directly with the
DMA hardware, not ones using standard GEMDOS calls.

Last Updated 10/18/99
- Sold / traded items removed

I have the following Atari ST components, software and manuals/magazines for
sale. All the equipment is cleaned and detailed, and in good or better
condition, but without boxes unless noted. If you have any questions in
regards to unit condition, please feel free to ask.

All prices quoted are in U.S. funds with the buyer paying shipping. For
items that I am taking offers on (no price listed), please make all offers
in U.S. funds. I am also willing to trade for certain items, please see my
list at the end of this post.

If you are interested in any of these items, please respond to Jim at
classic.games@NOSPAM.telusplanet.net (removing the NOSPAM first). Or email
me if you would like a current listing of items I have for other systems
(Atari 2600/5200/7800, Colecovision, Intellivision, Classic Computer,
Vectrex or Handheld games) sent to you, please specify system.

**Hardware** Please make an offer
=================================================================
- Atari 520 ST - with mouse but missing power supply
- Atari 520 ST - Boxed with power supply and mouse
- Atari Mega4 ST - Boxed with keyboards/mouse/power supply (two units left)
- Atari SC1224 Monitor 13" ST Color Monitor
- Atari PCT1426 Monitor 14" High Resolution TT/PC Color Monitor
- Viking 1280 x 960 20" Monochrome TT Moniter - Boxed
- Atari SF354 3.5" Floppy Drive - with drive cable, no power supply
- Atari SLM804 Laser Printer - boxed with power supply and Laser Printer
Controller
- Atari Megafile 44 with built-in Tape Backup - with power supply and cable
- Atari Megafile 60(s) - with power supply (two units left)
- Atari Portfolio PC Card Drive - Complete with box, manual & software. Like
New
- Magic Sac 1 - Macintosh Emulator Cartridge (with manuals, but NO ROMS)
- Magic Sac 1+ - Macintosh Emulator Cartridge (with manuals and ROMS)
- Custom made Atari RGB/Audio cable. Connects an Atari ST to either a SONY
XBR or XBR II RGB Monitor
- Best Data Smart One 2400X - 2400 baud modem

*Controllers* Please make an offer

I did not say when it would be finished over a year ago, in fact I did not publicise it much back then when I first gathered ideas as I knew it would take time. If you received other information it was erroneous. I am now well on the way towards completing the VMEbus card to validate the graphics subsystem. This card will also be useful for any TT or Mega STE users as a graphics card. I have also finished parts of the CPU accelerator and some other portions of the design. I hope to make the whole combined board next year. I fully intend to finish all of the projects that I announced, it just takes time.

You can read about some of my current projects on my WWW page at http://gem.win.co.nz/ .

Doctor Clu (drclu@swbell.net) wrote:
: Wow.. the more I hear about TT ram the more
: I realize I have not seen true TT speed. I saw
: an article in an old Toad Computing catalog that
: claimed that TT ram could make a speed increase
: of up to 300% with some applications. Now this
: is more like it!

There is no way you will see that speed increase in real life. Maybe in an obscure test that does not reflect reality. The figures everyone else is quoting sound much more realistic to me.

If you want to increase the speed of the TT it may be worth trying to find a second-hand CaTTamaran board that increases the TT's clock rate to 48 MHz. I have one and according to various benchmark programs there is a speed increase of around 30% in general. Not much but it all helps. The only problem I had is that the CaTTamaran was not compatible with ST-RAM boards. It would always crash. Having removed my ST-RAM board (I now have only 2 megabytes of ST-RAM) it works better but I think there is a heat problem as it sometimes crashes after a while. I am going to try putting a heat sink on the 030.

: I guess a good question to ask is, what
: programs DON'T work under TT ram?

If a program doesn't work with TT RAM you can always configure it to run in the old ST RAM. However I have yet to find a program that doesn't work in TT RAM (maybe some old programs that do DMA and don't know about TT RAM would be a problem).

: Perhaps you can answer me this question. I've
: heard that Spectre can work with system 7. Have
: you had any luck getting System 7 to work yet?

I did try it once and it didn't work. However I may have been doing something wrong. I cannot remember how it failed. Hmm not very helpful I know, maybe there is another Spectre user who can answer that question.

Uh-oh...

Taken from "http://www.napri.sk/web/satantronic/Warning.htm"
(BTW, what kind of name is 'Satantronic'... hmmm. Atari-flavoured
marketing at work.. ;-)

=======================
Warning for everyone thinking of buying anything from Core Designs
(former Titan). Don't purchase anything by sending cash directly to
them.
First thing is - they most probably don't have long advertised product
on stock as is typical for them
Second - once they have your money and even once had the product you
wanted - now it would be most probably sold out and you will never get
your money back
That's my personal experience where I lost 90 pounds trying to get them
back for more than one and a half year.
I don't trust them anymore. We might count all the products they
advertised and were never reliesed:
ï¿½ï¿½ï¿½ï¿½ Apex alpha
ï¿½ï¿½ï¿½ï¿½ Apex audio
ï¿½ï¿½ï¿½ï¿½ Nemesis (sold out without refund of cash)
ï¿½ï¿½ï¿½ï¿½ and Tempest will be the next

We would like this news to be spread amongst Atari community having
simmilar problems with CORE Designs.

Juraj Skladany
=======================

Hmmm. English (quite obviously) isn't this gentleman's first language
but I think the message shines through... Maybe I won't buy an Eclipse
for my Falcon then..

Best of luck in contacting them/getting your cash back!
Derek

Message-ID: <faTO3.632$Kw6.13473@typhoon01.swbell.net>
Source record: 71907

While the schematics could be challenging to
find, if you check out the TT 030 web page, there
are text files on how to modify a certain type of
2 meg ST ram board to 8 megs (to achieve a total
of 10 megs with the 8 meg daughterboard and the
onboard 2 megs of ram).

Now MY question is... has anyone done this
modification before, and if supplied the
daughterboard would they do it again (and some
money for the time and parts doing this.)

As for the TT ram and ST ram, as you can
see, I'm trying to break free of the 4 meg ST ram
threshhold my computer has. It is a great
computer, for the things the ST was originally
designed to do, but the internet surfing,
graphics... a little more ram wouldn't hurt. :)
So yeh, I would be interested in the possibilty
of boards being made, but please don't dally on
this one. Let me know soon what is planned.
(Like within a few weeks).

Thanks folks. Have to admit, it's finding
out what limits a TT can be pushed to. Pity I
might never find a CaTTamaran board at this stage
in the game.

Doctor Clu

Knowing you Frank, you probably have very
valid reason for saying that Spectre GCR does not
work with the TT. Perhaps it was not till much
later (perhaps the latest) version of Spectre
that allowed for cache and 68030 burst mode for
the TT 030.
The good news is, with a package o' stuff I
received from our common Genie friend, Roger
Nelson, there was a Spectre software that has
allowed me to work with Spectre.. and work with
it quite well.
(Let me know if you'd like to try it out.)

Perhaps Spectre only uses ST ram rather than
TT ram. (So far my TT does not have TT ram.) If
this is the case, that would match the fact that
Spectre GCR allows for a possible 12 meg of ram
that you can set for the program to work with.
(I guess ST ram peaks out at 14 megs, right?)

Hmmm... considering that sound, and Spectre
need ST ram by the looks of it, I think I see
which direction I need to be heading.

How about CAB? It's a fairly new (GEM)
program, does it make use of TT ram?

Doctor Clu

Atari TT 030 User who enjoys Pagestream,
CAB 2.7, Newsie, Speed of Light (jpeg), Everest,
Atari IRC, Spectre (Macintosh emulation), Freeze
Dried Term, Starball, M_Player (avi,mpeg, etc)
and last but not least....
Solitare (1998-1999 version).

(There you go, just to give you an idea of
what I use a TT for these days. (and therefore
what ram would be needed).

I had this problem also, I had to put the image in 'C:\'.
I also had to rename the image.

I have managed to get a very stable (works every time) Gemulator98 (running on
Win 95). I am using 800x600x16 screen res.

If nobody else does, I'll post a working setup tomorrow.

It has worked well so far, but does not seem to work with MiNT, which is
strange.

Grrr! I am trying to rev. up on W98 SE with an ATI Rage Pro graphics board running at 800x600x16. Fiasco!!

I have sussed how to get various o/s images loaded and am concentrating on TOS 2.06 ATM which is simpler to set up than the others.

However, with ANY o/s image I get garbage as emulated display. Green on black garbage for TOS, vertical black/white stripes with Magic. What on earth can I be doing wrong? Anything special you did to your display s/w, Gerry?

I note that the Gemulator site talks about problems with ATI graphics boards so I have updated my drivers etc. If this is really the problem then I'm snookered as I'm not buying new graphics h/w just for Gemulator.

> If nobody else does, I'll post a working setup tomorrow.

Yes, please, Gerry, I might learn something :-)

Roger

In special for Calamus it is very useful to have as much TT RAM as
possible.

It uses TT RAM and it also runs in it.

Greetings, Oliver (who worked for several years with a TT and Calamus)

Calamus SL works fine with TT-RAM. Maybe old Calamus version 1.09 doesn't.

Just about every program work with TT-RAM. Including CAB. You really don't have to worry about it. Everything will work fine. If you happen to find a program that doesn't work properly in TT-RAM (unlikely) then simply don't configure it to use TT-RAM.

And Spectre does work on the TT, I have used it myself... I thought it supported the TT-RAM (I seem to remember using more than 4 megabytes of RAM in Spectre even though I had only 4 megabytes of ST-RAM) but I may be remembering wrongly.

I'm afraid it's not quite that good.

If the tick is indeed 1/35 s (which is likely), 2 would mean 17-18 fps,
while 1 would indeed mean 35 fps. A flickering between 1 and 2 could mean
anything between those two values (closer to the one you see more often).
The list for the stable tick counts should be:

Ticks fps
1 35
2 17-18
3 11-12
4 8-9
5 7
6 5-6
7 5
etc

> Remember that this game I'm using is the VDI version. And this version

Yes, that's right.

>screen construct and one blit of the finished screen to the video ram on
>the card for each frame. This considering, the framerate I'm getting is

Since frame buffer accesses may well be slower (even much so) than
accesses to normal RAM, this could actually be the quickest way to do it.

Doctor Clu,

Atari has long had an excellent Bible concordance program called Spiritware. I wrote about it initially in one of my "Dealer Viewpoint" columns in GEnieLamp magazine back in 1990, and later helped Beta test subsequent versions.

As for Atari's being used in church environments, I had several church customers in previous years at Computer STudio who used their Atari systems for everything from membership management and billing to newsletter production, general correspondence and MIDI applications. Systems used included 1040ST's, MegaST, MegaSTe and TT030 models.

I have just spoken to David Encil. I too have been trying to contact him for what seems like months, as I too, sent a cheque for Eclipse and have not yet received it.

He appologises to us all, for the fact that he is not effectively running Cortex Design.

A family member is very ill, and he is unable to concetrate on his work.

He said he would honour existing orders. He could give me no timescale on when he would be back at work.

I have nothing to do with Cortex Designs, except in my capacity as a satisfied customer. I am posting this so that you all know David Encil's situation.

You're absolutely right. I forgot that I had the Pure C linker told to allow
programs to use TT ram if present. I didnt realize that this option in fact
sets a flag, where in Pure C you have to 'uncheck' a box. :-)

I think well because mine refused to work with TT ram .... I only was able to
use
more ram with my old 10 Mb St ram Mega STE (very rare because the price of
this
upgrade was definitely highly crazy, but for me it was a second handed one :)

both
> machines.

Well my preference is Neodesk, I just like the features it has in it and I use it well with Geneva. Although, I do have Thing as well which is quite nice, it looks crap in anything less than 256cols IMO.

> As most of my software probably won't multi-task due to the fact that it
was
> written pre Falcon it does not need to be Magic C compatable as I probably
> wont be using Magic C.

I use loads of old proggies that work fine under Geneva... as for MagiC I don't think I need to comment on this as many people know my opinion on that :)

> So which is the best of these desktops and how do they compair to what I
> assume is the relative new comer of System Solutions Jinnee.

I believe Jinnee to require plenty of processing power, at least the version I tried anyway, unless things have changed recently?

I suppose your best bet is probably Thing, but if you do want Neodesk I'll be selling a spare copy of mine at the Stafford show for an amazing £2, all proceeds go to ST+ :P

Thank you, you have been a wonderful audience, goodnight.

Kev.

Seconded, but I like the GUI!

:-)

And is it any wonder programmers don't feel inclined to support the Atari platform when people are so rude and hostile to those few people still willing to devote time to it?

Constructive criticism is fine, but the sheer rudeness displayed by certain people in this newsgroup is something else!

Personally, I find GEMTrade excellent, and I paid full price for my copy as well, and if I wasn't happy I'd say so, and why!

Programmers like Mark need feedback, constructive criticism and encouragement not the unknowing garbage spouted by some people here.

Give the man some Ambrosia I say!

:-)

I got my early Mega2 with UK TOS 1.2 and got the blitter chip later (it
was not available when I bought the computer) but still with the very
same 1.2 TOS. Actually 1.2 was called "blitter TOS". TOS 1.4 was called
"rainbow TOS".

SIPPs are SIMMs with Pins attached. The upgrade you want to do requires
you to
unsolder the SIPPs and replace them with SIMM holders.
I did the same upgrade and bought the SIMM holders from Maplin.
To check that things are OK remove the pins from the SIMM and
replace in the holders.

I did this about 1992 if I recall.

regards

yes!
Don't forget to to "Connect to host" first [menu item beside mail]
THEN go to the far left menu item and "Open" a news GRouP
(I think default.grp is supplied with newsie)
Afterwards, go back and "Disconnect from host"

956. FS: Atari 1040 MegaSTE w/ tons of developer docs

Newsgroup: comp.sys.atari.st
Date: 1999-10-19 00:00:00 UTC
From: kaf@_nwlink_._com_
Message-ID: <7uifrj$14n$1@swank.nwlink.com>
Source record: 71938

I've got an Atari MegaSTE 1040 forsale with 4 megs of ram. Here's the package:

* MegaSTE 1040
* SC1224 color monitor
* SM124 mono monitor
* pushbutton switch box to switch monitors (ie- no rewiring to switch)
* Keyboard (right shift key doesn't work, but this is supposedly an easy fix)
* Box with 4 manuals of developer documentation. Everything is here for software development (hardware gurus-- sorry, no schematics).
* Atari mouse

The 40 meg hard drive crapped out, don't know what's wrong with it. If you really want it, I'll ship it. I could throw in an older 1 gig Fujitsu M2266S-512 scsi drive I've got sitting around for, say, $15? Or I've got a 1 gig Quantum Empire 1400S for a bit more. I'm flexible.

Considering all the documentation, this system would be great in the hands of a developer. I originally thought I'd keep it incase my TT030 crapped out, but I've got no room for it. I'd like to get $200 but make an offer if that seems high. I'll pay up to $20 shipping from Seattle, WA, you pay the rest. If this doesn't go by the end of the month I'll try (ugh) ebay but I'd like to avoid that.

Any q's let me know. Remove underscores from my email address to reply. net.references available upon request.

the internal sounds of Ataris are very basic and low quality,but with the
built in Midi ports you can hook up all manner of keyboards and modules and
use sequencer programs or file players (plenty free ones) to generate any
music you like

|wont be using Magic C.

Try Teradesk which is freeware as far as I know. It allows you to
put files on the desktop and assign them to function keys.

I'm pretty sure (from reading rather than practical experience, though: I
started with an STE) 1.2/1.02 supported the blitter, as it's the one often
called "Blitter TOS", whereas 1.4/1.04 is "Rainbow TOS" due to the animated
rainbow fuji in the desktop About box. 1.4 is much better with hard drives
and needs fewer patches than 1.2, IIRC. 1.6/1.62 is Rainbow TOS plus the STE
specific extensions (1.62 fixed the medium res boot problem in 1.6).

Has anyone out there got chapter and verse?

Hu? Thing's code just differs between < 16 and >= 16 colors, so I
honestly can't understand why it should look crappy in 16 colors. It's
only that you can use more colorful backgrounds in more than 16 colors,
but I don't think this is what you ment, so please explain :)

Ciao

I wouldn't worry about that, most programs (except those that doesn't use the AES) works fine even with a multitasking OS like MagiC, Geneva or MiNT/N.AES.

> So which is the best of these desktops and how do they compair to what I
> assume is the relative new comer of System Solutions Jinnee.

As I said, Thing is superior, but it use slightly more memory that Neodesk. Jinnee is also very good, but it really needs MagiC. These two are also the only desktops that's currently supported, so the choice is IMHO simple.

As you can see I am still using Oasis,I think I was the last to register #49
I have to agree with all the comments about support, I in fact in a fit of
paddy i mailed Phil Yeadon (the author) and told him I would give the key
to anyone who asked for it, Bout the only time I got a reply :)

But the thing is I do'nt think there was ever a problem with Oasis I have
Okami/Newsie & mymail set up but my mailer/Newsreader of choice is still
Oasis, The problems were with the TC/Ip program ICE and the publicity that
it would connect using ppp which at the time was the Atari holy grail. Now
IMHO it worked fine with a SLIP connection but ppp was very flakey. So most
people slagged it off. I use Oasis now but I use Gary Priests POpwatch &
NEWSwatch with Sting ppp connection.It is still my opinion (for what it's
worth)that there is no other TOS mailer?newsreader to compare.
Want to know some of the features?????
The toolbox, Whilst running Oasis from the toolbox run stzip zip a file,call
up your editor of choice,copy a file using Kobold or whatever,you can put
any prog you want into the toolbox & use it,without ever leaving Oasis,I
found it the nearest thing to mutitasking posible.
Got a Mime picture in the mail,View it without first having to decode it.Any
other mailer do that???
Lack of support with Shareware is a funny thing,Most people who do Shareware
do it as a hobby or to gain programming expertise,They then move on,We
dinosuars who stick with the platform then get the narks on cos we need more
help.

Used with STING/POPwatch & NEWSwatch,I still find Oasis to be the best most
intuitive mailer I have used, The instuctions are I think an example of what
Shareware instructions should be,(anybody tried setting up reading the
instruction with Okami)I did & it took me three weeks.

I mailed the author only a week ago saying that I thought Oasis was still of
value & asking Phil to release a universal key to make it freeware,But he no
longer uses an Atari and could'nt if he wanted to.

Pete.

No, there were serious problems with most versions of Oasis 1 and 2,
particularly WRT news reading. Most versions not only didn't thread
properly, using the references line in the header, they also broke the
threading for other newsreaders. You are using a version which actually
doesn't break the threading, which is a rarity (but welcome). Unless
something dramatic happened with the last version of O2, though, it still
just did a subject line sort rather than threading proper, irrespective of
the references line issue.

Also, on slower machines such as STEs there was a serious problem with
multiple screen redraws just about any time you did anything, so you'd end
up watching the screen flicker for a matter of seconds each time. It was
also very unstable, with multiple crashes and lockups. Much better than ICE,
but not problem free. I suspect these problems were less evident on TTs and
Falcons.

Less of an issue if you run a multitasking OS, but I see what you mean. IIRC
you can set something similar up from Okami using a defined key, though I
could be wrong on this one.

> Got a Mime picture in the mail,View it without first having to decode
it.Any

Yup: Okami.

I don't have a problem with that on the whole as most shareware is cheap to register and works OK (Oasis 1 fell into that category by the end: while it was in its initial stages it was free so you didn't feel like you were being ripped off while they ironed out the worst of the bugs).

My problem with Oasis 2 was that it was expensive to register, wasn't what I for one would call a finished program (bearing in mind you were paying for the package as a whole, including ICE and that editor), and the authors took to ignoring registered users struggling with the bugs: understandable to a point if the thing only cost a fiver, but 30 quid should get you proper commercial-standard software IMHO, eg Connect, Kandinsky. That said there is always Wensuite I suppose as the other side of the coin...

Took me about 2 hours, but I know what you mean: most of the relevant info is in the config files rather than the docs. Worth it though.

news:7uiub9$2sov@edrn.newsguy.com...
> Is there an English version of this software or of the author's web page?

Yes, but the latest version in English is 1.2 unless an update has happened very recently. German version is up to 6.1. Not such a huge gap as there was only 6.0 in between as the version numbering was harmonised across platforms. However I believe that 6.1 is a vast improvement in many areas.

1.2 is however very usable, available from System Solutions in the UK, not sure about US distribution. Make sure you get NVDI too (either the PC version of NVDI4 or NVDI5 which is an all-platform release), otherwise it will seem slow.

> I have down-loaded the Demo but am having a heck of a time trying to set it up
> as my German is severely lacking.

Can't help you much with this as I have no idea of the limitations in the demo.

> Any help or comments about this emulator would be appreciated.

It's great if you are using applications other than games: for games you'd be better off with PacifiST, I believe.

Most apps which run under MagiC on the Atari will work unless they rely on specific hardware which is absent from MPC, so forget Falcon-specific and 030-specific software, also anything that needs to use the cartridge port (for either hardware connections or dongles). Older software is always a bit suck-it-and-see with multitasking OSes anyway, but much can be made to work by tweaking settings for limiting memory-hogs, sticking to standard ST screen resolutions etc. MPC can also use a TOS image instead of MagiC (with limitations), which might make a few other things work too.

<pedant>
Nope: they are still links (the original file stays where it is), but if you
delete the link it deletes the file as you say. Correct way to do it is to
use a menu item called "Remove icon" or some such (it's a while since I used
it).

Atari Games for Sale !!!!!!!

E-mail : oscar@agra.globalnet.co.uk

Work in all ST/STFM/STE Machines.

NOTE : All prices (noted with the symbol #) are in UK pounds
NOTE : All games are original, NOT copies !

** OFFER : Buy #10 pounds worth of gear and get any single game FREE

List of Productivity Software/Hardware : (#7 each + shipping in pound
sterling)
---
* Devpac III
* STOS Maestro Plus (Hardware Sampling cartridge and software included)
* PC SPEED v1.5 (Hardware and software - requires soldering - ST only)

List of Compilations :(#4 each game + shipping in pounds sterling)

** (ALL BOXED + MANUALS + ORIGINAL DISKS) **
* Giants
(includes Outrun, Gaunlet II, 1943 and Street Fighter)
* Quatro Sports
(includes BMX, Italia 90, Advanced Ski and Pro Tennis)
* Magnetic Scrolls Collection (1 Meg required)
(includes Fish, Corruption and Guild of Thieves)

List of Games : (#3 each game + shipping in pound sterling)

(ALL BOXED + MANUALS + DISKS)
* Baal
* Batman
* Deja Vu
* Driller
* Elite
* F-19 Stealth Fighter
* Falcon (Game + Mission Disk Vol 1)
* Galdregons Domain
* Ghouls 'n' Ghosts
* Gods
* Gold Rush
* Heimdall (1 Meg)
* Hook (1 Meg recommended)
* King's Quest II

* King's Quest III
* Quadralien
* Leader Board (Game + Tournament Disk Vol 1)
* Leather Goddesses of Phobos
* Lotus Esprit Turbo Challenge 2
* Magic Pockets
* Midnight Resistance
* Midwinter
* Navy Seals
* Night Breed
* Operation Wolf
* Purple Saturn Day
* Premier Manager 2
* Rick Dangerous
* Robinson's Request (1 Meg)
* Shadow of the Beast
* Sly Spy - Secret Agent
* Space Quest II
* Space Quest III
* Spy vs Spy (Artic Antics)
* The Patrician (1 Meg required)
* The Quest for the Time Bird
* Transartica
* Uninvited
* Zool

List of Games : (#2 each game + shipping in pounds sterling)

(NOT BOXED ONLY ORIGINAL DISKS + MANUALS)
* Another World
* King's Quest IV
* Leisure Suit Larry II
* Leisure Suit Larry III
* Operation Stealth
* Police Quest II
* Secret of the Monkey Island
* Storm Master
* Street Fighter II
* The Godfather III (Action Game)
* Wonderland

List of Games : (#1 each game + shipping in pounds sterling)

(NOT BOXED, (1)NO MANUALS, (2)ONLY ORIGINAL DISKS)
(1)Manuals are not really needed to play these games anyway
(2)Original Disks, we do not sell pirated software,so don't even ask.
* Alien Syndrome
* Crystals of Arborea
* Hard Drivin'
* Indiana Jones and the Last Crusade (Action Game)
* Oil Mania

* Panza Kick Boxing
* Rock 'n' Roll
* Silk Worm (Boxed but no manual)
* Spitting Image
* Strider
* The Hitchhiker's Guide to the Galaxy
* Trinity
* Trivial Pursuit
* Wrestlemania

980. Re: Accelerators...

Newsgroup: comp.sys.atari.st

Sure both Amiga and Apple have inexpensive accelerator cards that could be adapted, but someone would have to do a few custom chips, and probably build in one of Motorolas "special" cpus between the machine and card to boot the card. The HBS T36 is a decent mod for an ST. In mono with NVDI loaded, the little bugger really flys.

On 20 Oct 1999 12:16:38 , provvler@EUnet.yu wrote:

Just a thought: look in your INF file(s), MAGX and NEWDESK.
Does the first line show the correct figures for 115200 like this:
#a0;0021 -- the semicolon refers to 150bps, mapped to 115200.
If not it might show #a0<0021, which maps 134bps to 57600.
So anything that reads the INF (as at booting) adjusts the chosen port
accordingly, no matter what you chose in SERIAL.CPX, which saves its
own info internally.

Cheers, Charles.

PROTEXT.PRG (v 6.5x) won't work in TT ram. Indeed, it hates MagiC too
and only works in single mode, once MagxDesk is removed.
Unless someone knows differently......
Incidentally PageStream is the only app I know that loads in less
then a blink, even under plain TOS.

You'll not regret getting TT ram installed.

Cheers, Charles.

983. Re: Accelerators...

This thought has occurred to me as well. There is a homebrew 020
accelerator called the LUCAS that was made for the Amiga, which should
be drop in compatible with the ST. Also, it has an option for 2 mb 32
bit ram, and that may be the only hitch, requiring recoding of the GALs
to put it into the proper memory addressing range.

Hallo JI!

JL>I think 1.02 came with the early Megas but did not support the
JL>blitter - would that be right?

No, it came with the megas in order to support the blitter. My first machine was a mega, back in 1988, and that one came with 1.02 and blitter. 1.02 was called "blitter-tos", whereas 1.04 was called "rainbow-tos".

Yes, I know this, but I do see more 1 than 2 normally. In big open rooms
there is more 2's than 1's, tho, so it even's out pretty good. But
sometimes it peaks to 3 or even 4, but this is because there was a lot of
things running at the time I tested this. A list of things running
follows. This is what I always have running..

```

Hmm.. sure it wouldn't be faster to access slow ram a bit at a time when considering the write-buffer of the 060? Depends on how many separate writes and how close they are (i.e., how much other stuff is done between writes to this slow memory), I guess, since this "put-buffer" doesn't halt the writing instruction until it is filled (one cache-line). Then again, I might be way off here, cause I have no idea how drawing really takes place...

The SIMMs are obviously standard, so are the discrete components.
Where you would run into problems are the custom PAL chips, since
the source code isn't listed in the TT's service manual.

Actually, daughterboards have 8 MB. Adding the motherboard's own
2 Mb, you get.... 10 MB.

If you have a 2 MB daughteboard, it might be upgradable to 8 MB.
See the web site below....

Well if you want to try something extra cheap, there's Teradesk which can be downloaded off of any web archive around. You should get version 1.4 since it's most up to date. It's freeware, and I use it the majority of the time since it has a nice and fast file copy capability, plus a few other nice interface features.

I've put in a lot of time in on Neodesk too. Neodesk has the advantage of supporting what are called program groups. Basically you can group several names in a list which are accessable through a window after clicking on an icon for that group. It's similar to windows 3.1 program groups. The only thing that puts me off Neodesk is that the file operations like delete and copy are much slower than I care for, hence why I took a backward step to using Teradesk. Now I mostly use Neodesk in conjunction with Geneva multitasking.

Thing I have at least tried, and I find it to be a very good environment. It needs TOS 1.04 or better. It also has program groups. Aside from that it seems okay, although I haven't taken the time to benchmark it's file operation times.

Hope this helps...

Later...

Thanks!

The SpareMiNT one doesn't actually add anything much. If you didn't already know what MiNT is and what it is for, this won't tell you.

OK, here's the next version; I've incorporated the comments to the last one. Thanks to everyone who has contributed!

There are a few points I'd appreciate clarification on.

• On what machines was MultiTOS offered?

• Would it be useful to include information on alternative desktops?

• Are there other OSs I've missed? I'm not including Linux and similar, as they are not GEM-compatible.

Atari TOS/GEM history
v1.01
Liam Proven (lproven@hotmail.com) 20 Oct 1991

Historical versions
==========

OS: TOS [The Operating System]
Vendor: Atari
Version: 1.00
Machines: 260/520ST
Comments: Initial release. Fairly buggy; only used for compatibility with older programs. Desk accessories must be named DESKn.ACC. Loaded from disk, so also known as "RAM TOS" or "Disk TOS".

OS: TOS
Vendor: Atari
Version: 1.00
Machines: 520/1040ST
Comments: First ROM release. Updated GEMDOS and AES. AKA "Old TOS".

OS: TOS
Vendor: Atari
Version: 1.2 (later renumbered 1.02)
Machines: 520/1040ST/STF/SFM/STFM, Mega ST 2 and 4
Comments: First ROM-only version. Bug fixes; support for DMA/Blitter and real-time clock chips. AKA "Blitter TOS", "Mega TOS".

OS: TOS
Vendor: Atari

Version: 1.09
Machines: 520/1040ST/STF/SFM/STFM, Mega ST 2 and 4
Comments: UK version of 1.2.

OS: TOS
Vendor: Atari
Version: 1.4 (later 1.04)
Machines: 520/1040STFM, Mega ST 1/2/4, Stacey
Comments: Most common version of TOS; last version to run on pre-STe machines; most compatible with games. More bug fixes (e.g. archive attribute works); improved hard-disk handling and performance. Faster disk copy and file move, latter preserving date/time stamps; folder renaming; auto-run of GEM apps at startup; larger screen support; file "fastload" flag for faster startup; improved file selector; DOS-compatible disk format; keyboard reset. AKA "Rainbow TOS" because of animated colour Atari "Fuji" logo in desktop "About" dialog box.

OS: TOS
Vendor: Atari
Version: 1.6
Machine: 1040STE
Comments: As 1.(0)4 plus support for the enhanced STe. (Up to 4,096 colours; 8-bit stereo DMA sound; light-gun/paddle; external Genlock; hardware scrolling; etc.) Mouse support in "show file to screen" function; 4-bit colour values; disk boot-up delay. Bug fixes. ROM size grows from 256KB to 512KB. AKA "STE TOS".

OS: TOS
Vendor: Atari
Version: 1.62
Machine: 1040STE
Comments: As 1.6 plus bug-fixes, including of 1.6's failure to save selection of medium resolution correctly in DESKTOP.INF.

OS: TOS
Vendor: Atari
Versions: 2.02, 2.05, 2.06
Machine: Mega STE
Comments: Last version of Atari TOS for the 68000 line. Many bug fixes. Atari logo display at boot-up; automatic cold boot memory test; support for 1.4MB diskettes, 6ms step rate, better media-change detection. "NewDesk" desktop gains features from Gribnif's NeoDesk, including: definable keyboard shortcuts; install programs/files/folders as icons on desktop; install all available drives with one operation; automatic fitting of icons to window; configurable desktop and window colours, file and device icons; single-operation copy/move and rename; windows scrollable while files selected; "select all" command; programs startable with function keys; bypass program autostart by holding down Control key; enter special characters with Alt-[numeric keypad] combinations; file search function; file masks support; multiple desktop configurations; directory list printing; unsorted view; resolution change with

Alt-[number]; 7 windows allowed; bring-window-to-top function. Friendliest and most stable version, but loses compatibility by fixing bugs and changing undocumented features from v1.(0)4 that were used by older software. Preferred choice for serious ST use. AKA "Mega TOS", "Mega STE TOS".

OS: TOS
Vendor: Atari
Version: 3.01, 3.05, 3.06
Machine: TT
Comments: Similar to 2.0x but adapted for 68030 machines, including higher resolutions and fast RAM support. Adds GTP program support (GEM-Takes-Parameters), XCONTROL panel accessory, individual colouring of all window elements. Bug-fixes. AKA "TT TOS".

OS: TOS
Vendor: Atari
Version: 4.00, 4.01, 4.02, 4.04
Machine(s): Falcon
Comments: New version for the Falcon. 68030 only. Adds support for DSP, 16MHz blitter and video overlay. New v3.40 AES (last single-tasking version, but MiNT/MultiTOS-multitasking-aware) supports: hierarchical and pop-up menus; 3D window and dialog objects (later modified to to use more compatible ob_state flags instead of extended type); 256-colour "animated" icons; soft-loaded fonts; inter-app drag&drop; background window manipulation; extensible filesystems. New CPX module for international localisation configuration. V4.04 was the last official Atari version of TOS. AKA "3D TOS".

OS: TOS
Vendor: none (developed by Atari)
Version: 4.92, 4.98
Machine(s): Never officially released; distribution illegal
Comments: Bug-ridden internal developer version, but sometimes offered for download. Would have become TOS 5.0, "Falcon TOS".

OS component: MiNT [MiNT is Not (later, "Now") TOS]
Vendor: Atari
Version: 1.09 (last Atari version of MiNT)
Machine(s): All STs and compatibles
Comments: BSD Unix-based pre-emptive multitasking/multiuser kernel originally developed by Eric R. Smith. Replaces GEMDOS - provides process/memory management, filesystem I/O etc.; requires AES, VDI and desktop.

OS: MultiTOS
Vendor: Atari
Version: 1.04 (1.08 in unreleased beta)
Machine(s): Designed for Falcon/TT but runs on all STs and compatibles
Comments: Official Atari version. Extension to TOS 4: MiNT kernel + (very slow) multitasking v4.1 AES (AKA "MultiAES".) Runs on 68000, but requires 68030 for memory protection.

Current versions; under active development
==

OS: TOS
Vendor: Milan Computer GmbH
Version: 4.07 (website reports 4.5) [as at Oct 1999]
Machine(s): Milan
Comments: Debugged version of Atari TOS supplied with Milan
ST-compatibles
Website: http://www.milan-computer.de/

OS component: FreeMiNT
Version: 1.15.4 beta [as at Oct 1999]
Vendor: Free GPL software
Machine(s): All STs and compatibles
Comments: Open source version of MiNT, released by Atari after
withdrawal from ST market
Website: http://www.cs.uni-magdeburg.de/~fnaumann/mint/ (source
code)
ftp://ftp.stochastik.rwth-aachen.de/pub/atari/sparemint/
(SpareMiNT home)

OS component: N.AES
Version: 2.0 [as at Oct 1999]
Vendor: Woller Systeme
Machine(s): All STs and compatibles
Comments: Commercial replacement for Atari v4.1AES. Runs on MiNT.
Currently most useful AES for MiNT.
Website: http://www.woller.com/

OS component: Geneva
Version: 006 [as at Oct 1999]
Vendor: Gribnif
Machine(s): All STs and compatibles
Comments: Commercial replacement for Atari v4.1AES. Runs on MiNT or
TOS. Requires multitasking-aware desktop such as NeoDesk.
Website: http://www4.pair.com/gribnif/

OS component: NVDI
Version: 5.0 [as at Oct 1999]
Vendor: Behne & Behne Systemsoftware GbR
Machine(s): All STs and compatibles
Comments: Commercial replacement VDI. Works with MiNT, MagiC, TOS.
Much faster; provides TrueType and Speedo vector font support when used
with graphics accelerators. Commonly used for professional ST work. On
clones with special graphics hardware (such as Milan's S3 card), calls ROM
VDI graphics driver.
Website: http://www.nvdi.de/

OS component: oAESis
Version: 0.90 [as at Oct 1999]
Vendor: Free GPL software
Machine(s): All STs and compatibles

Comments: As-yet unfinished project to create a free AES for
FreeMiNT.
Website: http://www.nocrew.org/osis/oaesis/

OS: MultiOS
Version: 1.2 [as at Oct 1999]
Vendor: Milan Computer
Machine(s): Milan
Comments: Bundle comprising FreeMiNT kernel, N.AES and N.Thing
desktop; uses TOS 4.5 VDI.
Website: http://www.milan-computer.de/

OS: MagiC
Version: 6.1 [as at Oct 1999]
Vendor: Application Systems Heidelberg
Machine(s): All STs and compatibles; under emulation on Windows and
MacOS
Comments: Commercial TOS-compatible reverse-engineered OS for
ST/TT/Falcon & compatibles. Replaces GEMDOS, VDI, AES and desktop.
Supports both pre-emptive and co-operative multitasking, long filenames,
large disks. Adds some GEM/2 functions but does not support all functions
of 3.40 and 4.1 AES.
Website: http://www.application-systems.de/magic/

996. Re: 10MB ST RAM for TT

AFAIK Bernie Diotte, the former Atari dealer from Trois-Rivieres Quebec, is doing these ST-RAM upgrades in TT030 units currently. That was my impression the last I heard, 3 months ago.

from
> 256KB to 512KB. AKA "STE TOS".

STE's ROM size was 256 KB - you could upgrade to TOS 2.06 by just
changing the ROM chips.

TOS 2.x was in fact an adapted version of TOS 3.x because 3.x was
available before the 2.x release.

You mean there are desktops other than Thing? :)

With TOS 4.04 you can place files and applications on the desktop no problem. The Falcon desk is pretty nice, especially if your use to TOS 1.02. If your not going to multitask, you can get by with the one built into the Falcon to save a bit of memory and loading time. Just add Boxkite to your autofolder and you'll be happy.

Then the calculation must have changed.
It's pretty obvious from the code that ticks is the time since the last
frame was draw. It goes something like:
new_time = gettime();
ticks = new_time - last_time;
last_time = new_time;
The gettime() function (which isn't called quite that) returns one
quarter of a 140 Hz timing value, that is 35 Hz 'ticks'.

This means that it is impossible to get straight zeroes, since that
would mean that time doesn't advance at all. Straight ones means
exactly 35 fps, straight twos 17.5 fps and so on.

So, I think my table should be the correct one.

>Direct from id, the final formula for calculating the frame rate that
...
> 70
> --------------------
> <NUMBER OF DOTS> + 1

It's possible that this formula works on a PC, but I'm certainly not
getting the 14-18 fps in 8 bit mode on my Falcon+AB040+Eclipse that
this would indicate (if you replace ticks for dots). 9-12 fps seems a
lot closer to the truth.

>Note, though, that 70 Hz is the usual refresh rate a PC has in 320x240,
>and it seems that one should replace the 70 in the above formula with
>the screen refresh rate of your video mode (in case the port
>synchronizes its output with it, which would make sense).

I'm pretty sure that the screen is changed on VBL (if you're not running
in VDI mode), but that doesn't change the fact that the time base is
35 Hz.

I said 'could be' for a reason. ;-)

>considering the write-buffer of the 060? Depends on how many separate

I don't recall what the '060 bus interface looks like.
By 'write-buffer', do you mean copy-back cache or actual write combining?

Since the screen normally wouldn't be cached, the former shouldn't help,
but the latter might.

>writes and how close they are (i.e., how much other stuff is done between

Yes.

>writes to this slow memory), I guess, since this "put-buffer" doesn't halt
>the writing instruction until it is filled (one cache-line). Then again, I

Sounds like copy-back.

>might be way off here, cause I have no idea how drawing really takes
>place...

The problem is that DOOM draws walls vertically. In an eight bit mode
that means that there are lots of single byte writes far from eachother.
If the memory area in question isn't being cached that means up to four
times as many accesses have to be done.

On the other hand, the '060 can do some work between each of the writes
when it's texturing, so it's not quite as bad as that.

Then again, a graphics card can be optimized for blits rather than direct
writes, which can make a significant difference. I mean, the card might
do some internal buffering if you write to its 'blit registers', while
direct frame buffer accesses may go directly to the memory and have to

contend with for example the RAMDAC DMA. A VDI implementation would hopefully use the fastest transfer method for the specific card.

In summary, there are lots of things that can have an impact on performance. The only way to make sure is to test it, and then the results are only valid for that specific combination of hardware.

1002. Gemulator Setup that works (was RE: Emulators)

Newsgroup: comp.sys.atari.st
Date: 1999-10-20 00:00:00 UTC
From: pls@no.spam
Message-ID: <7ujscf$ar0$1@zharh00t.europe.nortel.com>
Source record: 71877

Here is my (working) Gemulator setup...

Make sure you have the latest version, which is...
Gemulator 98 Free release June 15,1999.

My setup parameters

Under "Options"->"Properties"

"Display" section
"Full Screen" & "Fast screen refresh" are selected.
"Monitor" is "Atari ST color".

"Hardware" section
"Memory" is 4M.
Everything else in this section is unselected or set to "none".

"Operating System" section

OS is "Atari ST Magic, 256K (C:\MAGIC_PC.OS).
(This is actually TOS 2.06 renamed),
"Shared printer port" is selected.
"Fast graphics" is selected.
"Boot disk" is C:

Under "Options"->"Disk Properties"
Atari ST internal floppy is mapped to floppy disk A:
Atari ST external floppy is disabled
Atari ST hard disk or SCSI device 0 is disabled.

"Options"-> "First Time Setup" gave me a lot of trouble, it could
not find the OS. I left everything alone (unselected) here & it
appeared to startup fine.

Under "Options"->"Debugging", only CPU-AUTO is selected.

The TOS 2.06 image is stored in C:\ as Magic_pc.os
I have a NEWDESK.INF file in C:\, this was created when
I used the SAVE DESKTOP option under TOS.

I have an AUTO folder on C:\ with a program called WINSIZER.PRG.
This utility allows the 800x600 res to be selected at startup.

When I run Gemulator, I get a message about CRC errors in the ROMS,
but this appears to be incorrect, as everything works fine.

There is a small amount of corruption on the screen , but this clears when
the desktop appears.

My WIN95 setup:

Configuration

Yes, you should use HSModem and Sockets.prg must be after the HSM
drivers in the auto folder.

Maybe your problem comes from your ISP trying a CHAP negotiation.
IConnect is not able to do this, neither is StiNG (just PAP or
script).

Bye,
/Pascal/

1005. Accelerators...

Newsgroup: comp.sys.atari.st
Date: 1999-10-20 00:00:00 UTC
From: provvler@EUnet.yu
Message-ID: <7uk6i2$2mh$1@SOLAIR2.EUnet.yu>
Source record: 71880

How to accelerate an old ST?
STe has its "Veloce" which is a very nice
product (a bit expensive AFAIK) but what do the
ST owners have? Two or three unavailable, spooky
16MHz boards or, maybe PAK68/30 which is "Power with an ULTRA price". Unacceptable.
Aren't these 68k processors an old, forgotten technology that is supposed to be cheap? Hey, we only need a 68020, around 20 MHz and a bit of FAST ram, is that too much to ask? Such a thing for an Amiga 500 or 600 costs peanuts!
I think some Viper boards for the Amigas just need to be put on top of the old processor so why couldn't we just do the same or even adapt them
for use in our machines?
I hope you are interested to discuss on this.

If you install Kobold along with NeoDesk you'll see a striking
difference in speed when deleting and copying files. Try it once and
you'll never want to be without it -- simply amazing.

It "looks" crap. Seeing it running on my milan, and then seeing it on the ST, you'll know what I mean. I swear I didn't think it was the same desktop.

However, Neodesk looks fine in all the resolutions I tried it in, but those were ST ones, so I suppose if you are using it on a Falcon then Thing would be the best choice

Kev.

> This contradicts the "ST A to Z" book. Are you sure?

The new TOS was first called "TT TOS" and developped for the TT.
This was TOS 3.01.

Later, when requests kept on pouring in for MEGA-ST's, Atari made
the MEGA-STE by repackaging the MEGA-ST design and adding newer
TT hardware ideas. The MEGA-STE prototypes came with TOS 2.02.

Later, MEGA-STE and TT TOS features were harmonized and a few
fixes added, which created TOS 2.05/3.05. Notice the parallel
version numbers.

Then, when the ST-Book was created, IDE drive support and a few
definitive fixes were added. This resulted in TOS 2.06/3.06.

For some silly reason, there exist two versions of TOS 2.06:

1) one-size-fits-all: can be used to upgrade any ST machine.

2) ST-Book specific: adds a built-in terminal software, to
compensate for the missing floppy disk. Kinda like the iMac
concept (no floppy; use networking to fetch stuff, instead),
but about 5 years ahead of its time.

Yes there was a German version that had to be burned into ROM. I
still use it dayly on a 1040 ST. It anounces KAOS030. and according
to docs it is a TOS 1.4 with errors removed.
maybe because it workst with the accellerator that was there for the
ST and used a 68030 CPU. But what was the name of that? '??Pack?'

Later they sold it commercially with a 'Kaos Desktop'. But that is
not the same product.

This seems definitely to be a problem that persists through several
versions of Newsie. I, too, have had the same problem several times
with sending e-mail and newsgroup messages.

Floppy-based. Followig TOS versions were all ROM-based.

> Version: 1.02
> Machine(s): 520ST

1040 ST and MEGA-ST too. A.k.a. "Blitter TOS"

> Version: 1.2

Actually, same as above 1.02, which is the correct version.

> Version: 1.4
> Machine(s): 520ST / 1040ST

Initially released for the Stacy. Upgradable on ST/MEGA too.
A.k.a. "Rainbow TOS"

> Comments: Most common version of TOS. Most compatible with games.

Definitely _not_ the most common; 1.02 is.

> Version: 1.6/1.62
> Machine(s): 1040 STE
> Comments: Support for the enhanced STe. More colors, etc...

That's, 1.06 and 1.62 (which really is 1.06.2).

> Version: 2.05/2.06
> Machine(s): MegaSTE

2.06 also is the definittive one-size-fits-all upgrade for all
ST, STE, MEGA and the Stacy. The prototype of this TOS was 2.02.

> Version: 3.05/3.06
> Machine(s): TT
> Comments: Similar to 2.0x but adapted for 68030 machines

TT TOS came first as TOS 3.01, while TOS 2.xx is basically the TT
TOS with BIOS rewritten for ST hardware instead of TT hardware.

> Version: 4.0x
> Machine(s): Falcon
> Comments: All-new version for the Falcon. DSP support, 68030 only.

Falcon-only. There were 4.01 and 4.02, which were mono-language,
while 4.04 included support for all 6 AES languages built-in and
the selected language setting is stored in the 68030's NVRAM.

> OS component: MiNT [MiNT is Not (later, "Now") TOS]
> Vendor: Atari
> Version: **???**

Last one under Atari was 1.04, while newer versions are Freeware.

> Vendor: Milan Computer GmbH
> Version: 4.5
> Machine(s): Milan
> Comments: Debugged version of Atari TOS supplied with Milan
> ST-compatibles

Not quite ST machines, the Milan. More like, Falcon without DSP.

Greetings;

I've got Gemulator running perfect - but have found that ONLY TOS 1.4 renamed to tos.img on the root of C is found. As the other dude said earlier, delete the gemulator.ini file from the windows dir first.

My machine also seems to want a floppy in A to boot Gemulator right.

hope that helps.

Willard.

>the Auto Folder should look like or give me advice on what could be
>wrong (could it be my ISP)?

When HSModem is not installed IConnect can't be started. The installation
of HSModem is OK otherwise you wouldn't be able to login...
There are various reasons for not being able to get a PPP connection.
Check:
- your login and password for typos
- if your ISP uses the CHAP protocol
- if the ETC path is set correctly in IConfig.

If all this still is no good, connect to your ISP using a communication
program, and see what parameters your ISP wants/needs, then make a script
file in IConfig.

Personally I think your ISP is using the CHAP protocol, AFAIK there's
nothing on the Atari platform (yet) which supports this. The only solution
is to find another ISP.

>Assuming I can get I-Connect to start working? Is there an IRC program
>for I-Connect? Last I heard they were still developing one.
Yes, Chatter from Jï¿½rgen Koneckzny, it's sold by ASH. You can download the
demo version from http://www.camelot.de/~zulu it's bilangual, English-
German.

Cheers from Belgium

For faster service, Please direct all replies through E-Mail to Ben at: atari@benjamin.net or bensmith@teleport.com instead of NewsGroups as I find it hard to keep up with NewsGroups.

Atarians Unite! Are you pining for the days of a simpler Computer? Do you miss Arcade Classics like Asteroids, BattleZone, Joust, Missile Command, Robotron 2084 and my favourite Star Raiders! Well Bravo Sierra Computers has them. Are you wandering, wandering in the desert of violent video games. Games too violent for children? With Blood & gore? Two companions of youth nowadays. Especially those you hear about in the news who kill fellow students at school. If your preferences for games lean more towards family friendly. Like it used to be. Try some of my Atari Arcade classics. I have oodles of Atari SoftWare! As well as truckloads of Atari HardWare. And Libraries of Atari Books. Reference material and things you thought you'd never find! So come check it out. The best of Classic Atari 8 Bit & Atari ST. E-Mail me at

e-mail: atari@benjamin.net

Or call me anytime at (503)256-9974 to talk to a warm, friendly, people person! Your more likely to reach me from 3 PM-3 AM Pacific Standard time. And thats most likely the times I can return calls. I'm perfectly willing to call you, on my own dime to answer your questions. I'm a people person and those who have dealt with me will find me patient, a good listener and even a good teacher. So if you can't call me Today? Call me Tomorrow!

Click for WebSite!

I've added more and will be adding more Hardware, Software, Books and Accessories for Classic 8 Bit and Atari ST. So checkout what's new on my WebSite. In Fact check it regularly as my Catalogs are updated regularly. I have 6 different Catalogs, and my SoftWare Catalogs are my largest. They have the biggest Byte Count. And remember if you can't come see me today, come see me tomorrow!

also, if you live in Portland, Oregon, interested in Atari and want to meet with other Atarians. Read the Ad near the bottom of this message.

FREE Catalogs for Classic Atari 8 Bit & Atari ST Computers! Hard-Ware, SoftWare, Books & Accessories! View Atari Catalogs on the Web at http://www.atari.benjamin.net And Jump to my FTP site linked to my Web Site so you can Download Free Catalogs or FTP directly to my site at: ftp.teleport.com/vendors/bensmith/ If you can't get Catalogs that way,

Feel free to Request catalogs through E-Mail. Really, it's not an inconvenience. I do ask that you specify Atari 8 Bit, Atari ST or Both! Then I'll send them to you by E-Mail Only. Not Snail (Postal) Mail. Please let me know if I can attach text files to your E-Mail. Catalogs are just regular ASCII text files so you can download them into your text editor and view them, edit them or print them out! It would make things easier for me if you take my Catalogs, load them into your text editor, delete what you don't want and E-Mail me the rest! To expedite things, include your complete Mailing address so I can figure your Shipping/Postage & Handling. I'll be back after the weekend.

If you have an Atari and live in Portland, Oregon. U.S.A. or vicinity, you are cordially invited to attend a Meeting of the Portland Atari Club. You don't have to be a member to attend. We meet the 2nd Tuesday of each Month. Our Next meeting will be Tuesday, November 9th, 7 pm at the Pizza Baron at 2604 S.E 122nd Avenue in Portland, Oregon. Get together with other Atarians. Make friends, meet new people, maybe find an old friend. Eat Pizza, drink Pop & Beer in a decorative atmosphere. Bring your family to a family friendly place. For more info try:

http://pac.pdxweb.net

e-mail: atari@benjamin.net

With the aid of an adaptor, possibly, but you won't be able to use it to its full capacity, only in monochrome (ST-Hi). Anything better will require a graphics card.

> also any recommendations for a reasonable word processor

Depends what you mean by a reasonable word processor :-)

1) Simple text editors (eg Everest) can be had for free.

2) There is a freeware word processor called Marcel which is one step up in that you get to use bold and italic and it will read/write RTF files which is useful if you have to swap files with PCs, Macs etc.

3) Next step is something like Protext which is very capable but not very cleanly programmed and doesn't give you full control of page layout (at least in the versions I've come across). It doesn't get on well with newer system software.

5) Full-blown document processors are thin on the ground these days, Papyrus being the only one easily obtainable in the UK. It's wonderful, but pricy. New version out soon, by all accounts, too. Proper WYSIWYG and neo-DTP page layout control but needs 4 megs RAM and a hard disk.

> and what price
> should i pay for a hard disk if that is i can still get them.

Check with the Upgrade Shop (Macclesfield) or System Solutions (London) for prices on new drives. You'll need a host adaptor too (see below).

> i'm
> fairly sure that the drive connection is scsi if that's true would a pc
> type be suitable

It's not SCSI, it's ACSI (Atari's nearly-SCSI), so you need a host adaptor which then lets you use standard SCSI drives. Check if the drive prices you are quoted include one and if not how much extra it will be. Also budget for decent driver software: the best is HDDriver available from Syetem Solutions. The author is a regular in this group and it's still being developed.

Be careful about using PC drives as not all of them will work (much is dependent on which host adaptor you get, older ones don't support parity, whatever that is: this excludes a lot of newer drives): you are best getting

the drive from an Atari dealer or buying second-hand Atari kit if unsure.
However, there are lots of people in this group who can give you expert
advice.

> If I'm wrong, I don't understand how we made one intact drive from
these two damaged ones.
That's quite normal practice to get one working from two dead
ones.
What *IS* strange is that friend1 could read half of his cartridge
or did he?
Was this useable data? Or did he have to reformat to regain use of
the intact half.

> A second friend could read (and format), but not write on his
> cartridge. Astonishing, isn't it?
What is so astonishing about that?

Now, SYQUEST had a habit of releaseing cheaper drives that were
existing technology but using one in stead of two sides per platter,
so SQ270 became EZflyer 135.
Maybe, just maybe, they were already working on this strategy in the
SQ555.
Maybe they thougt of releasing a 22Mb drive from which cartridges
should be read/write/formatable in the 44Mb drive.

Peter Schneider <Peter_Schneider@su2.maus.de> wrote in message
news:199910192126.a9161@su2.maus.de...
Hi Peter.

X>No, that won't work because you can't format the cartridge
single-sided.
that's true for floppies, but are you sure it's right for SQ
cartridges?

X>With one damaged head, you won't be able to write or read every
other
X>track!
Ok, supposed you're right, please explain me the following:

After an awful noise of his drive, a friend of mine had only 22 megs
on his cartridge.

A second friend could read (and format), but not write on his
cartridge. Astonishing, isn't it?

So we took the electronics from friend1's drive which we thought to be
intact (we thought one of his two heads had crashed) and put it onto
the drive of friend2 (whose heads we thought to be intact).

And what happened?

The drive works and has been working since (a couple of years)... :-)

If I'm wrong, I don't understand how we made one intact drive from
these two damaged ones.

Regards, Peter

Source record: 71819

Hmmmm, here in America I see them going for
$35-$60 on average (or new from Radio
Shack/Telegames for $140 or so....)

They are really interesting units. They
were fairly rare in the case that one Jaguar fan
once guessed about 50,000 were made. Not an
overabbundance is what I'm trying to say. As for
disks, much like the Jaguar platform, you have
quality over quanity. The CD games I've seen (my
favorites being Dragon's Lair, Space Ace, Myst,
Highlander, Primal Rage and VidGrid) are quite
good. And you can play kareokee disks too a
certain degree too.

Anyway, if you have a few bucks, go for it.
It's a neat gadget.

Source record: 71820

>
> > Are there other OSs I've missed? I'm not including Linux and similar,
> as they are not GEM-compatible.
>

Yep, there are:
KAOS
developed by Andreas Kromke. KAOS was a singletasking, GEM compatible operating system which replaced the normal TOS. It fixed a lot of bugs and was much faster than plain TOS - but the routines were not as flexible and therefore KAOS wasn't compatible with TT and Falcon (maybe also STE). It came with its own desktop KAOSDESK. Due to incompatibility and the availability of TOS 2.06 for all TOS computers KAOS disappeared. Software companies weren't willing to support an unofficial TOS/GEM replacement.

MultiGEM
by Maxon. Co-Operative multitasking extension to GEM. Two versions were available. This one also disappeared quickly after the release of MultiTOS and MagiC (MagX). I don't know much about its features but it seemed to be like Geneva.

Geneva doesn't require an external desktop. You can also start programs without a desktop. Geneva has an extended file selector which can do most of the file operations of an external desktop. Geneva has support for extended objects (Mac-like radiobuttons, checkboxes and frames).

I don't know if it's interesting for you but there is also an excellent patch program which can fix/change a lot of things in TOS/GEM and even adding new features. The patch programis so flexibile that you can patch all TOS versions and add new patches by just editing a text file.

Greetings,
Matt.

Good suggestion, I'll have to check that myself!

I always download and read my newsgroup articles, and post any replies OFFLINE. Then when I reconnect to the server, NEWSie automatically uploads my posts.

However, I've noticed that _sometimes_ NEWSie will "say" it's sending the article, but the dialog box disappears too quickly (during a successful "send" the cursor and dialog box seem to flicker a bit), and the message never gets posted. It is for this reason that I save a copy of all my posts in a folder _before_ I connect to the server, since as we know, NEWSie doesn't save the outgoing newsgroup posts as it does outgoing e-mail. This way if the posts never make it to the server, at least I don't have to retype them; I just repost and try again.

And for the record, I've made a request to John Rowjewski to add this "saving offline posts after sending" feature to a future NEWSie update.

**

And speaking of NEWSie problems...

Tonight I downloaded a large collection of articles from all my regular Atari groups, and since it had been a week or two since my last download, there were around 800 new messages in C.S.A.S.T alone. Well, something went a little wrong in the transfer. All the messages were retrieved, but when I opened the group window, instead of showing "800" messages, it showed the article number of the first message in the group ("85160" or something) - although hitting [?] when the group name was selected showed the proper starting and ending message numbers.

The problem after that was that although I was able to read the messages, deleting them and closing the overview window did not change the XOVER.TXT file, and the article titles were still there when re-opening the window.

I had to manually edit the XOVER.TXT file to delete the articles I'd already read, and manually change the FIRST and LAST message numbers to get it fixed and back to normal.

Anyway, no big deal, but I had never had this problem before.

On Tue, 19 Oct 1999 at 22:52:11 a message from omelette was created on
the subject of Jag CDROM, what's it worth?.
>Hi,
> I've just seen a Jaguar CDROM drive for sale - ï¿½45. Are these rare and
>was there much (if any!) CD s/w produced?
>

Hi

If this posting seams a little late, my original posting didn't get
posted; that's a PC for you:p

I've been after a Jag CD unit for yonks, and I'm willing to do a
straight swap with an amoeba, sorry Amiga! it's so hard to say:) CD32
with games. I bought it for Pinball Fantasies, and as I can get that on
another machine I no longer need it.

With a CD32 you can add other bits like keyboards etc... It really is an
a####### 1200 with out a disk drive, keyboard etc. I reckon that the CD32
is less prone to crashes than the 1200. It can also be used as a CD-ROM
drive for a 1200, with the correct software and cables.

It has ports for everything and can run, as far as I know, ALL 1200 CD's
and some of the early CD system (sorry the name has slipped off my
tongue, I hate that when it happens!).

I don't know what he's doing today. The last version is a few years old.
By the way, to view Before Dawn animations, you could also try the
freeware screensaver BUBBLES with it's module After Dawn.You can
download BUBBLES (bbls_v20.lzh), the module (aftrdawn.lzh) and a
collection of animations (bbls_mdl.lzh) from our website.

Hi Mike

I already bought one and I'm very pleased with it. Yes they are
available in Europe, but not on the other side of the atlantic.
I paid something like 6300skr roughly 800 dollars. Check my sig for
more info on my Milan (hopefully updated soon).

I have a friend who's just bought an Atari ST520 to use Cubase on it and
he was wondering is there anywhere in the UK that still sells upgrades.
He's looking for some extra memory, a hard drive and of course a copy of
cubase. Plus a printer.
He's based in Newcastle-upon-tyne is there anyone out there that can help him?

Thanks

Mark Wilkin

1054. [ANN] CoMa Voice/Pro 5.1.0 (Communication Manager)

Newsgroup: comp.sys.atari.st
Date: 1999-10-21 00:00:00 UTC
From: SiggiH@gmx.de
Message-ID: <1e010fn.9j7j9g8sr725N@p3e9ebf6e.dip0.t-ipconnect.de>
Source record: 71832

Programme-Name: CoMa for Atari Voice/Pro 5.1.0 (COmmunication-MAnager)

Purpose: Fax & voice-mail-system, to send & receive fax,
answering machine, mailbox & terminal with internal z-modem

Requirement: Computer with MagiC[Mac|PC] or TOS

Download: from Softbaer-Mailbox: +4930/62709-572 (ISDN X.75 & V.34)
or homepage: <http://i.am/Softbaer>

CoMa_Atari_5.1.0.zip (689 KBytes)

****

CoMa has the following common functions and attributes in all levels

- English documentation
- Support for the Elsa MicroLink Office & USR 56k (Pro)Message(Plus) modem
self-mode(read fax and voice & configuration)
- Fax-class 2 & 2.0
- Polling (send poll-request-tone only with class 2.0 and some class 2-modems)
- Network-capable fax-job-management (3 jobs in 24 hours)
- Serial fax
- Display of the calling-number with ISDN-modems
- Display of call units with ISDN-Modems
- Internal editor
- Incoming pages are displayed during fax-reception !!
- Text can be mixed with graphic-logos and signatures
- Fax-voice-data-number management, including groups
- Management for incoming fax/messages/mails
- Administration of 16 telephone companys
- Zone- & and time-dependent selection of telephone-company
- Mailbox with internal send & receive-z-modem
- Terminal mit internal z-modem & x-modem for modem firmware upload

* * * * * * * * * * CoMa Voice (additional) * * * * * * * * * *

- Answering machine for ZyXEL, Elsa/TKR, USR, Dr. Neuhaus, Lasat
and much modems with Rockwell-Chipset
- Day & time programmable answering messages
- Multiple outgoing messages for several ISDN-MSN
- Time dependent redicrection of incoming calls
- Remote control / recall of new received faxes
- Recall of 7 special messages by DTMF-code
- Real time decoding of sound for Mac/Atari-Soundsystem of ZxXEL
ADPCM3/ADPCM4, Smarty/Cybermod u-Law- & Rockwell ADPCM4-Sounds
- Wave-Sound conversion in ZyXEL- & Cybermod- & Rockwell-format

* * * * * * CoMa Professional Version (additional) * * * * * *

- Fax- and voice-on-demand-system
- Any amount of messages via DTMF tone recall is possible
- Each category can contain up to 100 messages and/or 100 fax-pages.
- Statistic of category recalls
- Voice-messages can be put together from multiple voice-files.
- For the mailbox you can assign personal passwords and
download-folders to as many users as you want
- Personal message for each caller, who has an entry in the numbers-list
(with ZyXEL Elite & MicroLink ISDN, if caller MSN is displayed)
- Unlimited fax-jobs
- Faxtransmission via polling request (DTMF-PIN not needed -
only for Class 2.0 modems)
- Permanent poll-sender possible (caller gets fax pages even without
sending a poll-request)
- Time-dependent messages for 10 MSNs for ISDN
- Connect-kind can differ for each MSN

* * * * * * * * * * * New in CoMa 5.1.0 * * * * * * * * * * * * *

* * * Voice * * *
- New entry in the calls list for "voice out" if only the OGM was played, but no
incoming message was recorded

- New calls-filter type "Only Voice Out"
- Logbook entry for OGMs
- Logbook will open with the new entry in the function pop-up
- After silence is detected, the message-end file is played and no data- or
fax-receive is tried, if a DTMF-code has been recognized previously

* * * Terminal/Mailbox * * *
-X-modem protocol for modem firmware upload
-Mailbox: only one entry in the calls list by new login

* * * Fax * * *
- IMG-files in fax-outgoing-, polling-, jobs-, or demand-folder will be send now
without manual converting in fax-format
- Alert-box if fax number is missing while making a fax job
- Date in SENDINFO.TXT is now 4 digits long (just for a better design, not realy
necessary!)

* * * Selfmode * * *
- For Microlink Office FW1.20: tollsaver can be disabled now
- USR Message Plus: the data is been checked if they are in valid range
- USR Message Plus: no alert-box "no modem response"

* * * General * * *
- 16 telephone companies adjustable
- Closing a text-window can be canceled now

- Various bugfixes

****
<mailto:S.Hartmann@berlin.de> or <mailto:SiggiH@gmx.de>
<http://i.am/Softbaer> or <http://ww.ThePentagon.com/Softbaer>
Mailbox: 030/62709-572 ISDN X.75 (64000 bps) & V.34 (28800 bps)
Voice: 030/62709-466 Fax: -459 Voice & Fax-On-Demand-Test-System: -573

I too, am still using Teradesk, the 1.36 version at that. There is something in 1.4 that conflicts with some aspect of my system, so I wnt back to 1.36. It does crash if there is no diskette in the A drive and some command sequence starts looking for files in A:\. Other than that, it's rock-solid.

I would have thought that the PAK30 was now a bargain-basement item. When was it released, two and a half years ago, or even before that? That is an eternity in computer technology.

I will speak kindly of the rare but great ICD AdSpeed board. It came bundled with a variant of Mihocka's Quick ST which was tweaked to take advantage of this chip. I have it in my 1040STe and it is fast. Also, contrary to what has been rumoured, it will still run NOTATOR and other MIDI applications.

No. I Bought a Hades because it came with a '060 processor - at the time the Milan was a '040. I understand they are introducing a '060 based model but their website tends to suggest that the operating system will be Magic, and that's something I don't like.

I might consider a Phenix in the future _if_ I can't get my CDR problem sorted and _if_ voice recognition is going to be available.

Yes, it is an eternity when something goes into serial production and sells very well through those two and a half years. In the PC world 2-3 years is an eternity no matter how you look at it. But in the Atari market
things are different. I had a look at the prices about a month ago: PAK68/3, kit, without CPU, 330DM
PAK68/3, kit, with 33MHz CPU and TOS 3.06, 595DM
,and the same thing but assembled: 695DM
I think they ("Woller & link") don't even update that page. There is no need for that.

>I will speak kindly of the rare but great ICD AdSpeed >board.

I've heard of that one, and I believe it's great, I would love to have it. But there you are: IT IS RARE!
It is not made anymore. Why? Is it such a piece of modern, expensive and very complicated techology?
It's a plain CPU booster that pushes the old 68000 to its limits, and OK, it has an extra cache which makes "it the real thing", at least that's what I know.
Can someone make such an accelerator for us?
Buy it off of ICD?
> It came bundled with a variant of Mihocka's Quick ST >which was tweaked to take
>advantage of this chip.

Atari TOS/GEM history
v1.01
Liam Proven (lproven@hotmail.com) 20 Oct 1991

Historical versions
===================

OS: TOS [The Operating System]
Vendor: Atari
Version: 1.00
Machines: 260/520ST
Comments: Initial release. Fairly buggy; only used for compatibility
with older programs. Desk accessories must be named DESKn.ACC. Loaded from
disk, so also known as "RAM TOS" or "Disk TOS".

OS: TOS
Vendor: Atari
Version: 1.00
Machines: 520/1040ST
Comments: First ROM release. Updated GEMDOS and AES. AKA "Old TOS",
"ROM TOS".

OS: TOS
Vendor: Atari
Version: 1.2 (later renumbered 1.02)
Machines: 520/1040ST/STF/SFM/STFM, Mega ST 2 and 4
Comments: First ROM-only version. Bug fixes; support for DMA/Blitter
and real-time clock chips. AKA "Blitter TOS", "Mega TOS".

OS: TOS
Vendor: Atari
Version: "1.09"
Machines: 520/1040ST/STF/SFM/STFM, Mega ST 2 and 4
Comments: Incorrectly-reported number for UK version of 1.2.

OS: TOS
Vendor: Atari
Version: 1.4 (later 1.04)
Machines: 520/1040STFM, Mega ST 1/2/4, Stacey
```

Comments: Most common version of TOS; last version to run on pre-STe machines; most compatible with games. More bug fixes (e.g. archive attribute works); improved hard-disk handling and performance. Faster disk copy; file move function; copy preserves date/time stamps; folder renaming; auto-run of GEM apps at startup; larger screen support; file "fastload" flag for faster startup; improved file selector; DOS-compatible disk format; keyboard reset. AKA "Rainbow TOS" because of animated colour Atari "Fuji" logo in desktop "About" dialog box.

OS: TOS
Vendor: Atari
Version: 1.6
Machine: 1040STE
Comments: As 1.(0)4 plus support for the enhanced STe. (Up to 4,096 colours; 8-bit stereo DMA sound; light-gun/paddle; external Genlock; hardware scrolling; etc.) Mouse support in "show file to screen" function; 4-bit colour values; disk boot-up delay. Bug fixes. AKA "STE TOS".

OS: TOS
Vendor: Atari
Version: 1.62
Machine: 1040STE
Comments: As 1.6 plus bug-fixes, including of 1.6's failure to save selection of medium resolution correctly in DESKTOP.INF.

OS: TOS
Vendor: Atari
Versions: 2.02, 2.05, 2.06
Machine: Mega STE
Comments: Last version of Atari TOS for the 68000 line. Many bug fixes. Atari logo display at boot-up; automatic cold boot memory test; support for 1.4MB diskettes, 6ms step rate, better media-change detection. "NewDesk" desktop gains features from Gribnif's NeoDesk, including: definable keyboard shortcuts; install programs/files/folders as icons on desktop; install all available drives with one operation; automatic fitting of icons to window; configurable desktop and window colours, file and device icons; single-operation copy/move and rename; windows scrollable while files selected; "select all" command; programs startable with function keys; bypass program autostart by holding down Control key; enter special characters with Alt-[numeric keypad] combinations; file search function; file masks support; multiple desktop configurations; directory list printing; unsorted view; resolution change with Alt-[number]; 7 windows allowed; bring-window-to-top function. Friendliest and most stable version, but loses compatibility by fixing bugs and changing undocumented features from v1.(0)4 that were used by older software. Preferred choice for serious ST use. Version 2.05 incorporated features from TOS 3.05 to harmonise the two. AKA "Mega STE TOS".

OS: TOS
Vendor: Atari
Version: 2.08

Machine: STbook
Comments: ?

OS: TOS
Vendor: Atari
Version: 3.01, 3.05, 3.06
Machine: TT
Comments: Similar to 2.0x but adapted for 68030 machines, including higher resolutions and fast RAM support. Adds GTP program support (GEM-Takes-Parameters), XCONTROL panel accessory, individual colouring of all window elements. Bug-fixes. ROM size grows from 256KB to 512KB. AKA "TT TOS".

OS: TOS
Vendor: Atari
Version: 4.00, 4.01, 4.02, 4.04
Machine(s): Falcon
Comments: New version for the Falcon. 68030 only. Adds support for DSP, 16MHz blitter and video overlay. New v3.40 AES (last single-tasking version, but MiNT/MultiTOS-multitasking-aware) supports: hierarchical and pop-up menus; 3D window and dialog objects (later modified to to use more compatible ob_state flags instead of extended type); 256-colour "animated" icons; soft-loaded fonts; inter-app drag&drop; background window manipulation; extensible filesystems. New CPX module for international localisation configuration. V4.04 was the last official Atari version of TOS. AKA "3D TOS".

OS: TOS
Vendor: none (developed by Atari)
Version: 4.92, 4.98
Machine(s): Never officially released; distribution illegal
Comments: Bug-ridden internal developer version, but sometimes offered for download. Would have become TOS 5.0, "Falcon TOS".

OS component: MiNT [MiNT is Not (later, "Now") TOS]
Vendor: Atari
Version: 1.09 (last Atari version of MiNT)
Machine(s): All STs and compatibles
Comments: BSD Unix-based pre-emptive multitasking/multiuser kernel originally developed by Eric R. Smith. Replaces GEMDOS - provides process/memory management, filesystem I/O etc.; requires AES, VDI and desktop.

OS: MultiTOS
Vendor: Atari
Version: 1.04 (1.08 in unreleased beta)
Machine(s): Falcon (but runs on all STs and compatibles)
Comments: Official Atari version. Extension to TOS 4: MiNT kernel + (very slow) multitasking v4.1 AES (AKA "MultiAES".) Runs on 68000, but requires 68030 for memory protection.

OS: Kaos TOS
Vendor: Andreas Kromke
Version: ***?***
Machine(s): All STs and compatibles
Comments: Early single-tasking GEM-compatible TOS replacement.
Faster and less bug-ridden, but incompatible with TT and Falcon (maybe
also STE). Supplied with own desktop, KaosDesk. Development stopped after
release of TOS 2.06.

OS: MultiGEM
Vendor: Maxor
Version: ***?***
Machine(s): All STs and compatibles
Comments: Co-operative multitasking GEM extension (c.f. Geneva). Two
versions were available. Development stopped after release of MultiTOS and
MagiC.

Current versions; under active development
==

OS: TOS
Vendor: Milan Computer GmbH
Version: 4.07 (website reports 4.5) [as at Oct 1999]
Machine(s): Milan
Comments: Debugged version of Atari TOS supplied with Milan
ST-compatibles. Adds MagiC-compatible extended objects (e.g. crossbuttons,
checkbuttons, frames).
Website: http://www.milan-computer.de/

OS component: FreeMiNT
Version: 1.15.4 beta [as at Oct 1999]
Vendor: Free GPL software
Machine(s): All STs and compatibles
Comments: Open source version of MiNT, released by Atari after
withdrawal from ST market
Website: http://www.cs.uni-magdeburg.de/~fnaumann/mint/ (source
code)
ftp://ftp.stochastik.rwth-aachen.de/pub/atari/sparemint/
(SpareMiNT home)

OS component: N.AES
Version: 2.0 [as at Oct 1999]
Vendor: Woller Systeme
Machine(s): All STs and compatibles
Comments: Commercial replacement for Atari v4.1AES. Runs on MiNT.
Currently most useful AES for MiNT.
Website: http://www.woller.com/

OS component: Geneva
Version: 006 [as at Oct 1999]
Vendor: Gribnif
Machine(s): All STs and compatibles
Comments: Commercial multitasking replacement for Atari v4.1AES.

Runs on MiNT or TOS. Works best with multitasking-aware desktop such as NeoDesk, but can be used without desktop via extended file selector. Adds keyboard control to GEM menus and dialogs; GEM.CNF startup script; dynamic loading/unloading of desk accessories;
Website: http://www4.pair.com/gribnif/

OS component: NVDI
Version: 5.0 [as at Oct 1999]
Vendor: Behne & Behne Systemsoftware GbR
Machine(s): All STs and compatibles
Comments: Commercial replacement VDI. Works with MiNT, MagiC, TOS. Much faster; provides TrueType and Speedo vector font support when used with graphics accelerators. Commonly used for professional ST work. On clones with special graphics hardware (such as Milan's S3 card), calls ROM VDI graphics driver.
Website: http://www.nvdi.de/gb/NVDI5.html

OS component: oAESis
Version: 0.90 [as at Oct 1999]
Vendor: Free GPL software
Machine(s): All STs and compatibles
Comments: As-yet unfinished project to create a free AES for FreeMiNT.
Website: http://www.nocrew.org/osis/oaesis/

OS: MultiOS
Version: 1.2 [as at Oct 1999]
Vendor: Milan Computer
Machine(s): Milan
Comments: Bundle comprising FreeMiNT kernel, N.AES and N.Thing desktop; uses TOS 4.5 VDI.
Website: http://www.milan-computer.de/

OS: MagiC [formerly MagX]
Version: 6.1 [as at Oct 1999]
Vendor: Application Systems Heidelberg
Machine(s): All STs and compatibles; under emulation on Windows and MacOS
Comments: Commercial TOS-compatible reverse-engineered OS for ST/TT/Falcon & compatibles. Replaces GEMDOS, VDI, and AES. Has own desktop (MagXdesk) but also works with other replacements. Supports both pre-emptive and co-operative multitasking, long filenames, large disks. Adds some GEM/2 functions but does not support all functions of 3.40 and 4.1 AES.
Website: http://www.application-systems.de/magic/

OS Component: Jinnee
Version: 2.0
Vendor: Application Systems Heidelberg
Machine(s): All STs and compatibles
Comments: Replacement desktop. Runs on TOS and MagiC. Borrows features from MacOS 8 (such as spring folders and pop-up windows) and

Windows Explorer. Supports: placing icons on the desktop; symbolic links; long file names; hotkeys for applications, even from within other apps; association by file-type or wildcards; dynamic loading of desk accessories; desktop sticky-notes; file undelete from the trashcan; intelligent window placement; selection of files by typing the first few characters of the name; selectable desktop backgrounds and sound effects.
Website: http://www.application-systems.de/jinnee/

OS Component: NeoDesk
Version: 4
Vendor: Gribnif
Machine(s): All STs and compatibles
Comments: Replacement desktop for TOS. Supports multitasking if used with Geneva, but does not require it. Adds: program groups; background file copy/move, disk formatting; menu bars within windows; operation of the desktop within a window or as a desk accessory; command-line interface and macro language; recoverable trashcan; control panel; screen savers; icon editor with Windows .ICO import; desktop notes; file clipboard (holds files in RAM); directory sorting; desktop background patterns and wallpapers; split windows with multiple views; colours/fonts/icons selectable on a per-window basis; non-modal dialogs;
Website: http://www4.pair.com/gribnif/neodesk.htm

OS Component: Thing
Version: 1.27e
Vendor: Thomas Binder
Machine(s): All STs and compatibles
Comments: Replacement desktop. Adds: 3D look; file cut/copy/paste; case-sensitive sort; apply button for settings changes; contextual menus; removable media eject option; TrueColour support.
Website:
http://www.cix.co.uk/~inactive/inactive/software/thng120.htm

OS Component: Gemini
Version: 1.A
Vendor: Stefan Eissing
Machine(s): All STs and compatibles
Comments: Replacement desktop ("Venus") tightly integrated with a console-window CLI ("Mupfel", a version of UNIX ksh). ***More info needed!***
Website: http://user.tninet.se/~gcc561r/desktops/gemini.html
http://www.muenster.de/~reschke/soft_e.html

The current version is 2.3. Other details enclosed in email...

A version 3.0 is in the works offering amongst other things: French (thanks to the hard work of TransAction member Didier Briel) and much better script support including macros! You will be able to configure your own GEMTrade features.

Mark.

file.
>
> Please tell us more?

You can specify the address which should be modified in the config file
for the patch program. A lot of people have added patches to this file
so you can get the most bug free TOS version ever. I don't remember all
of the patches that are possible but one of them can turn off
grow/shrinkboxes. It's really simple to add patches e.g. I've add two
patches which modify TOS version and date.
You can also change the system font of TOS (permanently!).
The resource file of the GEM desktop can be changed with an ordinary
rsc editor. So you can: change the standard icons or even add new ones,
change the mouse pointers, the desktop dialogs, messages etc. .
Another feature is that you can use another image instead of the Atari
logo displayed in TOS2.x/3.x/4.x! There was even an "Intel Outside!"
logo supplied with the program.

There is only one limit of the patch program: TOS size should not
increase over 192 KB (ST), 256 KB (STE) and 512 KB (Falcon). I've done
patches on the STE TOS. This limit is only important if you want to add
icons or make changes to the rsc.

Ok, here's the URL:
http://www.stud.uni-hamburg.de/users/in5y280/tospatch.html

The program patches TOS 1.04, 2.06, 2.06 ST-Book, 3.06, 4.04.

Hi,

if you consider buying a Milan wait for the Milan II. The 2nd Milan is manufactured by a professional hardware producer and Milan GbR have made some interesting alliances so the Milan II should also be available almost everywhere.
They present the Milan II at the TOS fair in Hannover.

BTW, I have a Milan though but I didn't buy it. There are some things I don't like of the Milan. Browsing the net with 65000 colours and Adamas pro works great but it lacks in the game/sound department.

Greetings,
Matt.

1074. Final reminder - UK Adventurers Convention

Newsgroup: comp.sys.atari.st
Date: 1999-10-22 00:00:00 UTC
From: karen <karvic@btinternet.com>
Message-ID: <7uov4g$a9l$2@plutonium.btinternet.com>
Source record: 71722

Just a final reminder about the UK Adventurers Convention in Birmingham next weekend - hope to see some of you there....

The Tenth Anniversary Adventurer`s Convention

The Royal Angus Thistle Hotel, Birmingham, Saturday, 30th October, 1999, 9am to 6pm.

Well - who'd have thought that we'd still be going strong after 10 years!

As usual the convention will run from 9am on the Saturday until 6pm and will still cover all formats.
Tables will be available if you wish to bring your own computer, and we actively encourage this, so the
more the merrier! You are welcome to bring along software/hardware for sale too, although no pirated
software please.

Adventurers come from all over the country, including Northern Ireland, and the atmosphere is very
friendly and informal. Many of us stay overnight at the hotel and the Friday and Saturday evenings are
just as lively and entertaining as the Convention itself. We still haven't managed to attract anyone from
outside the UK but we are still living in hope!

During the day we have the popular Megapoints competition running in which contestants get 20
minutes playing time at a specially written text adventure, with the object of scoring as many points as
possible in the allotted time. There are usually cash prizes and certificates for the 3 highest scorers.
(Well everyone says we should be certified!) The game this year is being written by Edwina Brown, and
the only information we have is that it will celebrate our 10th Anniversary.

Tickets are available now, and in honour of our anniversary, the price has been lowered to £5 per
person.

The Royal Angus Thistle Hotel has again given us special room rates for those attending. These include
full English breakfast and are:- Single Room £40 per person per night, and Double Room or Twin £35
per person per night. Please contact the Hotel direct to book your rooms - the address is The Royal

Angus Thistle Hotel, St Chad's, Queensway, Birmingham B4 6HY, telephone 0121 236 4211 and we would suggest that you book early. Make sure you tell the Hotel that you are attending the Adventurers Convention otherwise the room prices are about double the above!

If you have any queries about the convention, or would like to reserve tables for hardware or software please contact either Larry Horsfield or Karen Tyers:

email: Larry - alaric@larryhorsfield.demon.co.uk

Karen - karvic@btinternet.com

Do come and join us, even if only for the Saturday. If you've never been before, you'll have a great time, and maybe you'll at last be able to put faces to those names you've only heard about, and you'll certainly go home with a lot of new friends. If you have been before, but perhaps only to the earlier conventions, you'll be able to renew old friendships. We'll look forward to seeing you there.

1075. Re: Keyboard Problems with 1040STE

Make sure you do not have a joystick plugged in and set on autofire. Also, try replacing the mouse. After years of use, the connectors seem to get worn and short out causing half the keyboard to not work. Also make sure that any "dongles" you have are connected securely.

B.P.

AFAICR, the blitter only became available in 1987 - as standard fitment to Mega STs.

As a former owner of a TOS 1.2 1040 STFM, and later a 1.2 Mega 4, the "Blitter" menu option was not available on the desktop Options menu of the STFM (it didn't have a blitter), however it did appear on the menu of the Mega. It was a simple select the menu item to switch the blitter on (which placed a check mark next to the menu item), and select the menu to switch it off (which removed the check mark)

Blitters were supposed to be available for users to fit to their machines, but I do not recall seeing any adverts selling blitter chips. (BTW: If so, did any ST machine have a blitter socket for one to fit an after market blitter? And did anyone ever fit one? What sort of results did you get compared to a Mega with a factory-fitted blitter?)

To utilise the blitter, one needed TOS 1.2, which introduced the Blitmode() XBIOS call to configure system software to either use or ignore the blitter. AFAIK, TOS 1.0 (the original TOS version fitted to machines from 1985-1987/8) was "blitter ignorant" and lacked the Blitmode() call, and had no way to use a blitter. (Custom software could, however, be written to detect such a chip, and use it, but I do not recall anyone ever doing so)

(I haven't really used an ST/Mega for seven years, since i got my TT, [which lacks a blitter, and there are times I really wish it had one] so some of my memories may be a bit hazy)

--

All email sent to my inca address will fail, however I can now be contacted via an intermediary : gem at gem win co nz. I would like to apologise to the genuine respondents that this may inconvenience.

Is it true that they will ship it ONLY with MagiC-Milan? Why? Would it not be fair to allow buyers to choose which OS they want if they are to buy a new computer? Why abandon N.AES? This sounds like very bad news to me. :(

Plus 68030 support!

l> OS: TOS
l> Vendor: Atari
l> Version: 3.01, 3.05, 3.06
l> Machine: TT
l> Comments: Similar to 2.0x but adapted for 68030 machines, (...)
Not really (look above). It is "just" a new, enhanced OS for the TT
series.
TOS 2 is in fact a "specialized" version of *earlier* TOS 3 for the ST
series
(also 68030 compatible, often used with 68020/68030 accelerators for the
ST
series).

l> OS: Kaos TOS
l> Vendor: Andreas Kromke
l> Version: ***?***
Last version I am aware of is 1.4.1. But maybe, there are newer ones.

l> Machine(s): All STs and compatibles
l> Comments: Early single-tasking GEM-compatible TOS replacement.
l> Faster and less bug-ridden, but incompatible with TT and Falcon (maybe
l> also STE). Supplied with own desktop, KaosDesk. Development stopped
after
l> release of TOS 2.06.
Can be used as RAM and ROM based OS, supports 68030, sometimes used with
accelerator boards.

l> OS: MultiGEM
l> Vendor: Maxor
Maxon

l> OS component: NVDI
l> Version: 5.0 [as at Oct 1999]
l> Vendor: Behne & Behne Systemsoftware GbR
l> Machine(s): All STs and compatibles
l> Comments: Commercial replacement VDI. Works with MiNT, MagiC, TOS.
l> Much faster; provides TrueType and Speedo vector font support when used

l> with graphics accelerators. (...)
Wrong. Also supporting Postscript Type 1 fonts and, of course, standard
GDOS
bitmap fonts. NVDI is not just a replacement of VDI, in addition it is a
replacement of GDOS (it also could be configured as a replacement of VDI
only, using another GDOS, or as a replacement of GDOS only, using another

VDI).

So using the various types of fonts has nothing to to with acceleration
(new
VDI accelerates, GDOS is for font handling).

l> OS: MagiC [formerly MagX]
l> Version: 6.1 [as at Oct 1999]
l> Vendor: Application Systems Heidelberg
l> Machine(s): All STs and compatibles; under emulation on Windows and
l> MacOS
Including the Milan (shall be delivered with the new Milan II), which is
not
ST compatible, but TOS compatible (like the TT) and also Mac (and Windows
95/
98/NT with integrated ST emulation). Note: MagiC Mac does *not* emulate an

Atari, it even doesn't emulate a 68000!

Missing:
OS: GEM
Vendor: ABC Software Holland
Version: 2.2
Machine(s): -
Comments: Port of PC GEM/2 for ST series. AES and VDI replacement (much
faster VDI than TOS 1.04). Uses GEMDOS of built-in TOS.

Because of the topic and having in mind, that (hardware independent) GEM
consists of GEMDOS and AES, maybe it would make sense to add the version
numbers of both (at least, the number of AES)? An overview about the
different types of GDOS could also be nice (GDOS, FSM-GDOS, Speedo-GDOS,
...). GDOS (Graphics Device Operating System) is built in at PC GEM, but a

separate program at Atari GEM.

BTW: GEM development stayed compatible between PC and Atari including TOS
1.x
and PC GEM/2 (new functions got unique numbers). With TOS 3 Atari
introduced
new functions on numbers, which are already occupied by PC GEM/3.

Hello Martin-Eric,

qf> > Comments: Most common version of TOS. Most compatible with games.
qf> Definitely _not_ the most common; 1.02 is.
At least here in Germany, which is probably the biggest Atari market, it
is
the most common version for the ST series.

qf> That's, 1.06 and 1.62 (which really is 1.06.2).
Are you *really* sure, that Atari changed also the numbering of TOS 1.6?
As
to my knowledge, they didn't (but nobody knows everything ;-)).

qf> Not quite ST machines, the Milan. More like, Falcon without DSP.
More like faster and better TT's? ;-)

>He's looking for some extra memory, a hard drive and of course a copy of
>cubase. Plus a printer.
>He's based in Newcastle-upon-tyne is there anyone out there that can help him?
>

Hi

It all depends what model ST it is, the letter/s AFTER the ST on the
badge. The STE's are the easiest to upgrade.

The STF/STFM/ST are a little trickier depending on whether you have
socketed MMU & Video shifters.

I believe The Upgrade Shop SHOULD be able to help with memory upgrades
for ST's, but as I've given up asking for a product/services list from
them, I can't recommend them:(

I do do upgrades for STE's ANY sort from ï¿½15 for a standard 4 meg STE
upgrade. This includes software, fitting instruction and postage.

I'm an ST Book owner and it does have a 2.08 TOS version, this one is
merely
a 2.06 with some notebook specific features and IDE support.

My TT has only a TOS 3.05 so I don't know if TOS 3.06 has builtin IDE
support
but AFAIK only the ST Book and the Falcon have this feature.

Built-in ST Book software are STTRANS (a null-modem and parallel data
transfer program), a power management program, hard disk drive utilities
and drivers (AHDI, XHDI, BOOKINST and BOOKFMT), and a ram disk
installer. They aren't really part of the TOS even if they are located
into the same 512Kb EPROM chip.

Eddy.

Not sure about development stopping: Andreas Kromke is the author of MagiC.
As to the relationship between KAOS and MagiC I'm not sure of the ins and
outs, but there are indications of a relationship, eg MCMD (the CLI supplied
with MagiC and used by Magxdesk) is actually the CLI from KAOS, if the
documentation is to be believed.

KAOSdesk was also usable with normal TOS, too, I think. It was certainly
available on its own from some PDLs.

<snip>
> OS: MagiC [formerly MagX]

Actually I think it was written Mag!X at the time.

> Other replacement desktops - info wanted:
> . Ease

Often bundled with MagiC, particularly early on. Effectively replaced by
Jinnee as the (commercial) power-users' desktop for MagiC.

> . Teradesk

Freeware desktop for TOS, final version (1.40a???) included multitasking
support and could be used with MagiC, possibly MiNT/MultiTOS too.
Incorporated many features from TOS 2.x, including icons on the desktop,
drag and drop to desktop icons, configurable command lines for programs
requiring switches etc. IIRC included its own file viewer for viewing text
files in windows (vast improvement over TOS file viewer). No support for
long file names or newer system features, though, as development stopped
quite a while ago.

Hello,

I would like to sell ALL of my ST stuff, and I have ALOT!!!

I can either post a list here or I can do the Ebay thing. I'd like to hear a few opinions.

I'd prefer to post here because I have alot of hacker stuff (individual components) that requires some technical expertise to use.

A few examples are:

SLM 804 printer NIB, but no controller. Navarone sheet feed scanner, motherboards, drives, service manuals, chips, TOS, Abacus books, etc., etc., etc. I'd like to sell everything as one lot.

I'd also like to sell in a fair manner.

I also have a Medusa (68040 but TOS is in german!) that I may sell if I can get a decent price, but I'm willing to sell everything fairly cheap (except shipping which will be expensive. Like I said I have ALOT of stuff).

P.S. I'm a former Vice President of FRAUG! (Front Range Atari Users Group)

I'd probably agree, but...

All modern PC machines are derived from the IBM *AT* design, not the original PC - but they are not called AT-compatibles, are they?

It's not even the "AT bus" any more, it's called ISA.

If I could get the demo to run, I'd look. It complains about System 8 in
German! (I /think./)

Of course, it doesn't need to emulate the 68000; the Mac has (or does)
that for it. This doesn't mean it's not an emulator.

1088. monitor for TT030

Newsgroup: comp.sys.atari.st
Date: 1999-10-22 00:00:00 UTC
From: Guaka <guaka@smiley.nu>
Message-ID: <7uq548$ln8$1@wnnews.sci.kun.nl>
Source record: 71736

Hello Atarians!

I just found another Atari at the dump: a TT030!
It came with a keyboard, and luckily I still have 2 Atari mice.
I tried a VGA monitor with it, and that's okay, but I want to
run Cubase on it, and that's not working. Some way I need
to get the monochrome mode (?) working. Would it be possible
to connect a SM124 to it?
I'd also like to know how I can use the harddisk it has. Do I have
to run certain programs before it starts? Some kind of bootdisk?
(Now it doesn't do anything...)

Greetz,
Kasper
(always getting more and more old computers at home this way :-)

Yes, sadly but true. The Milan II will come with MagiCMilan. Not quite
sure about this but I though MagiCMilan will be put into EPROM but afaik it
will be possible to skip MagiC at boottime and use N_AES instead.

Why? I suppose ASH sponsors the developement of the Milan II which Woller
couldn't/wouldn't do.

I've 'heard' that there is a release 007 of Geneva in German for
sale in Germany. May be nothing but rumour.

Hello Liam,

l> > qf> Not quite ST machines, the Milan. More like, Falcon without DSP.
l> > More like faster and better TT's? ;-)
l> I'd probably agree, but...
Hmm, maybe you answer belongs more to Martin-Eric than to me? Or you or I

misunderstood something. =;-)

But anyway ;-):
l> It's not even the "AT bus" any more, it's called ISA.
Even the TT had a (relative) different system architecture compared to the
ST
line (with an extensible bus system, not ISA, but VME). The Falcon line
was a
little bit more "back to the roots" (at least, the produced one, not the
Microbox prototype).

The Milan goes much further: It has standard PC architecture (PCI bus) and

standard PC components.

So it is really not a ST machine (not even near to that). It is "just" a
quite fast TOS compatible (or, within this terms more likely: GEM
compatible
;-)) 68k computer. :-)

Message-ID: <199910220000.a5138@lu.maus.de>
Source record: 71748

Hello Liam,

l> > Note: MagiC Mac does *not* emulate
l> > an Atari, it even doesn't emulate a 68000!
l> If I could get the demo to run, I'd look. It complains about System 8
in
l> German! (I /think./)
Hmm, cannot imagine that. But "MagiC" and "demo" is a chapter for itself
...
:-/

l> Of course, it doesn't need to emulate the 68000; the Mac has (or does)
l> that for it.
Of course. :)

l> This doesn't mean it's not an emulator.
Of course. But anyway: It is not an emulator. 8-)

Explanation: Of course, on Power Macs MagiC Mac is using the capabilities
of
the system itself to run (emulate) 68k code. Anyway, it is not MagiC Mac
who
emulates the 68k CPU. The better the MacOS does the job, the faster is
MagiC
Mac.

On the other side: MagiC Mac doesn't need a Power PC Mac. It runs even on
68k
Macs (again, no 68k emulation needed by MagiC Mac ;-)).

So the only thing MagiC Mac has to emulate, is the OS (from BIOS to AES).
But
that is not necessary, MagiC Mac *is* the OS itself. :-)) In addition,
there
are a very few "hardware calls" captured.

Disadvantage: MagiC Mac is not a very compatible emulator at low level. ST

programs which goes into hardware don't run, whereas MagiC PC is a
complete
(and very compatible) emulator of either a 68000 CPU and ST hardware. Much

more programs run on MagiC PC.

Advantage: MagiC Mac is incredibly fast. Much faster than the faster Power
PC
68k emulation and the faster Power PC CPU could make it compared to a fast

PC. And it is better integrated within the Mac environment, than it's PC counterpart.

l> > Because of the topic and having in mind, that (hardware independent)
l> > GEM consists of GEMDOS and AES, maybe it would make sense to add the
l> > version numbers of both (at least, the number of AES)? An overview
l> > about the different types of GDOS could also be nice (GDOS, FSM-GDOS,
l> > Speedo-GDOS, ...). GDOS (Graphics Device Operating System) is built in
l> > at PC GEM, but a separate program at Atari GEM.
l> OK. Can you supply the info?
Oops! =;-)

For the different AES and GEMDOS versions I've been lacking of time at the

moment. :-(

And I never really use(d) GDOS by myself, but I think, I can give a starting
point (so I think, I got all, but don't trust the posted informations to much!! ;-)):

GDOS (Graphics Device Operating System):

GDOS: GDOS
Vendor: Atari
Version: ?
Comments: Original GDOS from Digital Research, port of PC GEM/1 GDOS. Supplied with some GEM applications and the Atari laser printer. Distribution
stopped with release of FontGDOS.

GDOS: AMC-GDOS
Vendor: AMC
Version: ?
Comments: Slightly better, faster GDOS, some bugfixes. Distributed with AMC
software and later in license by Atari (at least in Germany) together with

the original GDOS.

GDOS: G+Plus
Vendor: CodeHead
Version: ? (1988/1989)
Comments: Slightly better, commercial GDOS, some bugfixes.

GDOS: FontGDOS
Vendor: Atari
Version: ? (1992)
Comments: Supporting TT screen resolutions; Bitmap Caching; better RAM usage
(fonts loaded "as needed"); GEM/3 Bezier Curve VDI routines; more printer

drivers, including Deskjet, Paintjet, Okidata Color, Epson Compatible
24-pin
BW and Color; easily changing of printer drivers on-the-fly; easily
selection
or installing of other GDOS drivers.

GDOS: FSMGDOS
Vendor: Atari
Version: ?
Comments: Font Scaling Mechanism (FSM) GDOS, supporting Speedo vector
fonts.
Never official released, beta status

GDOS: SpeedoGDOS
Vendor: Compo Software
Version: ? (1993)
Comments: Commercial GDOS, supports Speedo vector fonts, since version 5
also
TrueType and Postscript Type 1 vector fonts.

GDOS: NVDI (known entries)
Comments: Since version 3 Speedo and TrueType vector fonts (Postscript
Type 1
fonts with additional module), since version 5 Postscript Type 1 fonts.

I'm not sure which version it is, but I do have _a_ version of Sequencer One that came on a cover disk - it was either ST Format or Atari ST User. Anyway, I'd have to dig around for it in my cover disk archives, but I'm pretty sure I could find it. I'll make it available on my web site and post here when it's available (assuming the original poster is still looking for it).

> get compared to a Mega with a factory-fitted blitter?)

Late model 520STFM and 1040STFM computers had the motherboard drilled to
accept a blitter socket. You had to remove the solder from the holes and
install the socket yourself. Performance was theoretically the same as a
Mega ST, as they came with Mega TOS.
>
> (I haven't really used an ST/Mega for seven years, since i got my TT,
> [which lacks a blitter, and there are times I really wish it had one] so
> some of my memories may be a bit hazy)

There is a softblit program for the TT that emulates the blitter for
software that requires it, but most agree that the Atari blitter is not
really accelerating anything, and so modern software, such as NVDI, shut
it off anyway.

This is all I needed to do too, then all of a sudden gemulator found the
TOS and runs in ST mode.

> My machine also seems to want a floppy in A to boot Gemulator right.

Mine does too, but after searching the drive boots ok

I havent had a chance to play with gemulator much yet - what already
bugs me though is that if the focus is on gemulator, the mouse only
works within the emulation screen, making gemulator impossible to turn
off by normal methods (I hasd to kill it using the task manager) is this
right???

Right. Firstly thanks to Paul Williamson who pointed out that I was asking the modem to report the speed of communication with the computer - not with the other end of the line. This has been corrected and I get 44000 with Modem 2 set to 230400 _or_ 115200. Nevertheless it was my impression (and this may well be wrong) that downloading was quicker with 230400.

|The quality of the phone line is always a limiting factor.

I can see that this is bound to be so.

|> Certainly the download spped in CAB has increased
|> enormously from an average of 400 and occasional 1200 to average of
|> 7000 and occasional 12000.
|
|Ha! I wouldn't believe these big figures - you get these when the modem
|decompression expands a big compressed chunk. The rate that this can be
|delivered to your 'puter is determined by DTE rather than DCE.

I presume that CAB is clocking the number of bytes _it_ receives per second rather than reading the modem output - is this not so?

Anyway, at the end of the day things are a good deal better and I am now tempted to go surfing!

ticalc.org is pretty much the best place to start. I know there
are ST programs that can be used with the "$5 parallel cable" but
I'm not sure if any work with the 89. All the transfer programs
and cables are in the "hardware" section of ticalc.org.

This one cropped up a while back as Demon's Dfax service produces these
files. There certainly wasn't any viewer for the Atari at that time, so
unless something has been updated recently, I think you are out of luck.

Sorry to butt in, but there is a copy of the GDOS FAQ at:

http://www.dtek.chalmers.se/~d2cg/gem/docs/gdos_faq.txt

...though it is a little out of date now (stops at NVDI 3). It covers the
differences between the versions, capabilities, printer drivers etc.

You can find a later version (2.7 as opposed to 2.3 by searching Dejanews
for "joy of gdos" (older articles: the last version was posted to c.s.a.s in
95).

>fenixVDI. A VDI under development and being developed for Titan's 'Tempest"

Actually, the proper name is fVDI. It just happens to stand for
Fenix/Free/Fast VDI. It's true that it is still under development, but
the vast majority of the programs I've tried run just fine even now
(I would very much like to hear about anything that causes trouble, but I
guess I'll have to bring the normal bitplane device drivers up to date
first).

There is no connection between fVDI and the Tempest so far, even though
I expect to port it to that (it's a PPC accelerator card) later on.
You're probably thinking of the Eclipse (PCI bridge board), for which
a hardware accelerated ATI RageII fVDI device driver has been developed.
Drivers are available for the normal Atari monochrome and 16 colour modes
as well as Falcon TC too (these do not work with the latest fVDI engine,
though, since I've been concentrating on the Eclipse/RageII recently).

>Falcon card. works in conjunction with nVDI.

It _can_ work in conjunction with NVDI. If you don't need vector fonts
or other drivers than those mentioned above, fVDI works just fine on
its own (can be quite a bit faster too).
fVDI should also work together with any GDOS, but I've only tried it
with FontGDOS.

When fVDI is used together with NVDI, FontGDOS etc, the latter will
normally be in control, the way GDOSes usually are. It's also possible,
however, to let fVDI take care of the devices it knows about (currently
only the screen) all by itself and pass calls on other devices through.

OS component: fVDI
Version: 0.95beta [991016]
Vendor: Free GPL software
Machine(s): Drivers available for normal Atari 1/4 bitplanes, FalconTC
and Eclipse/RageII
Comments: Almost complete replacement for original VDI/GDOS with some
of the later extensions, such as Bezier curves/areas.
Work still in progress.
Website: http://rand.thn.htu.se/

Also, don't forget XaAES.

OS component: XaAES
Version: beta7+ [March '99]
Vendor: Free software (probably GPL, but I'm not 100% sure)
Machine(s): All STs and compatibles running MiNT
Comments: Preemptively multitasking AES.
'Officially' dead, but worked on from time to time.
Website: None that I know (the original one has disappeared).
Latest beta can be found at ftp://rand.thn.htu.se

|set it to 115200 - I just checked it now and it was re-set to 57600
|- it has happened before that a program has reset the speed).
| . . . .
```

Thanks for the response. The problem seems to have been that I was using 'Serial Ports' with STiK and STiK contained the wrong setting in its configuration file. Since changing to STinG (and thanks to Jim S again for sending me his configuration files) the problem has not recurred.

I have installed a new 56K modem and have Modem 2 speed in Serial Ports set to 230400 but am told by DIALER that I am only connecting at 30400. Certainly the download spped in CAB has increased enormously from an average of 400 and occasional 1200 to average of 7000 and occasional 12000.

This was brought up before. I think the consensus was that only the
first page could be read, but this required Photoline, TruePaint, or
Touchup (which have barebones support for CCITT-compressed fax TIFFs).

Unless someone states otherwise, I think the answer was no. Richard
Ewell was tackling this problem -- perhaps he'll stop by and report how
he made out.

There's a way to do the conversions online but requires an FTP program
and a browser (not very elegant).

fVDI has nothing to do with the Tempest itself. It is a freeware
VDI replacement that happens to have drivers for the Tempest. The
"f" _does_ mean Fenix, though, since it was supposed to be a part
of that much expected MiNT successor.

Yes mate

I have the demo on a site but it is not the latest version . Its still
brilliant though. I ran a BBS under it for two years plus. (The full
version BTW)

I am selling my version though now as I have switched to PC mainly due
to work commitments. I am asking for offers for mine and it comes
with NVDI PC which it really does need to be useful IMHO..

Anyway in the meantime try this URL

http://www.easyweb.easynet.co.uk/a.taylor

at least I think thats the URL. Its been a while since I checked the
site so I will check and get back to you again if this is not the URL.

I have a lot of experience with Magic PC if you get stuck just shout
as it's not the easiest thing to use AT FIRST. Its the setting up that
is quite awkward after that it's a breeze to use and very very fast
indeed.

Hope this helps.

I have to support Mark on this. GEMTrade is well written and works fine under MultiTOS and Magic on my Milan and ST respectively.

I did have problems with an early version which didn't like ST medium res but I think that was fixed ages ago.

Some of the translations are bit odd with some strange non-extistant words appearing in the English and some simple German words that aren't translated but they are probably in the original Ruftrade (I don't know because I never owned it).

I have another translation package called GER2ENG which has dictionaries in csv text files allowing words to be added or removed. This doesn't work as a CAB module though.

I tried every fax and graphics program I find on the 'net. Nothing
would, as far as I could tell load in these fax TIFFs.

There are, of course, plenty of PC programs that will load them but
I don't have, and don't really want, a PC at home.

I have found a slightly more convienient method of viewing the TIFF
files which involves transfering them to my Psion Series 5mx and
using the very good picture viewer MBMView. The latest version of
MBMView will view the multi-page TIFFs that Demon's fax-to-email
system generates. Not ideal but it does work.

Obviously if anyone does know of an Atari prog. that will view these
files then I and many others would, I am sure, be interested to know.

Richard Elwell.

>Regarding NG posts:
> Are you sure it's a Newsie problem and not a news server problem?
>I'm using .94 and never had an E-mail problem but have had NG server errors
>(including posts which mysteriously disappear after posting OK!).

Well, indeed, I can not be really sure. But I have not noticed anyone
complaining of the same problem with some other news or mail software.
Does anyone knows of other people having such problems with other software-
on PCs, Amigas, Macs? If we establish that such things happen there as often,
then indeed Newsie is not to blame.

But maybe STiNG is, though? I have had problems with sending long e-mails
using Newsie and STiNG 1.20, so I use STiNG 1.15. Maybe it is some time-out
that expires before anything is sent if the server is very loaded,
and STiNG or Newsie do not notice or do not take care?

On the other hand, even if it is the fault of news or mail servers, or even
the whole news concept, then the reality is such as it is, and maybe a
good piece of software might make sure in some way that an article or an
e-mail has indeed been sent. I am not familiar with details of the protocols
so I can not say how to do it, but I suppose it can be done.

As for disappearing e-mail, I have set that copies of outgoing messages are
always sent to myself, so after sending messages I always check that I have
received them all back- but I don't like that very much, I would prefer
reliable transmitting.

Btw, I have seen some newsgroup messages appearing several times, and
with a same identification. Maybe it is the opposite side of the same
problem- some objects disappearing without trace in unknown black holes,
and other appearing suddenly from nowhere :)

Message-ID: <7usf96$ep3$1@bgtnsc01.worldnet.att.net>
Source record: 71771

Kasper,

The TT030's standard graphic modes can run all of its resolutions, except for TT-High, on a regular SVGA monitor. These resolutions include ST-Low, ST-Medium, ST-High (640 x 400 monochrome), TT-Low, and TT-Medium. To run TT-High, you will need one of Atari's high-res 19" monitors (TTM194 or TTM195). TT-High is obviously the best for Cubase, but you can also run it nicely in ST-High res on a standard SVGA monitor.

You should note that the "unique" proportions of the Atari display will probably require internal adjustment of most SVGA monitors to get a properly proportioned picture. Best way to adjust the display is have a program generate a graphic circle on the screen, then adjust the circle so it is perfectly round.

I know that there's a MiNT-based set of utilities someone did in France
for the PalmPilot about two years ago; that would work well if you're
running nAES as your operating system. What with how well the Milan is
doing, I wouldn't be surprised if someone in Germany is doing another one
at this very minute :)

Hi Mike,

this is obviously the wrong conclusion. I've seen thru 'the years
numerous questions about ST's, STe's, Falcons, Hadeses and Milans as
well. If your conclusion after 4 flat tyres in a Beetle after 2 days
driving and never ever have driven just one other car, is that the
Beetle is a bad car with lotsa problems, you're heading the same way.

Is a PC with an AMD K7 Athlon a bad computer because some DOS programs
don't run on it?
The ST is an excellent computer, so is the Mega Ste. So is the TT and
just IMO I don't like the Falcon. Personal thing. Never owned one,
since I never wanted one. Read the Dutch Atari mailing list and your
conclusion would be the Milan is a no go... :-)

I never ever regretted the purchase of my TT, all the additions and
whatever with it. Now it sits more or less idling since I switched to
a PC box... Nothing wrong with it, anyway.

Friend of mine is working on a new website for Atari (also PC and Amiga)..
He only has catalog working at moment, hardly any graphics with a basic
setup and he would appreciate some feedback. It's fully useable so please
try it out.

http://catalog.zen.co.uk/actinic/16_32_SystemsX/

Maybe there are just more TT030 computers than any others, and most of the TT questions seem to come from new users. My TT has worked reliably for years. I had a lot more software conflict problems on my Falcon than on the TT.

1140. New Atari Sales Area fcrom 16/32

Newsgroup: comp.sys.atari.st
Date: 1999-10-23 00:00:00 UTC
From: Nick Harlow <nick@1632systems.co.uk>
Message-ID: <7usoel$37$2@plutonium.compulink.co.uk>
Source record: 71781

First of all apologies if you have read this message in another newsgroup.

16/32 Systems are setting up a new domain with full retail catalogue. At the moment we have a basic catalog set up and will be expanding on this every day, we plan to publish articles, help files in a general area as well. I would like to make this a first or even second stop for Atari Users. The catalog at moment is fully useable and if you wish to order then please do so. Whilst we are knocking this area in to shape we will confirm each price before sending.

However I require input, please browse pages as they come if you wish and let me know what you would like to see either available or as general interest. If you wish to contribute or have any other queries please email below. If you wish just to be kept informed then email me and I will add you to the list.

The reasons for this are basically due to personal (sickness) matters I am closing my shop and concentrating on Mail Order plus Internet stuff plus my contract work. So I am going to have a lot more available time and I might as well use it.

The URL at the moment is http://catalog.zen.co.uk/actinic/16_32_SystemsX/

You can now email me on nick@1632systems.co.uk or nahrlow@cix.compulink.co.uk

Thanks for your time

Nick Harlow

> at 30400.

The quality of the phone line is always a limiting factor. Try setting the DTE at 115k - you may be getting some faulty blocks and repeats at 230k. If this doesn't work it's worth checking all your phone connections from the modem outwards and, if this has no effect, moaning at your phone service provider. I have heard that people can generally manage 44k, I can sometimes get 46k (deepending on the weather etc. :-)) Sometimes the phone company can improve things a bit by tweaking the line amplifier.

> Certainly the download spped in CAB has increased
> enormously from an average of 400 and occasional 1200 to average of
> 7000 and occasional 12000.

Ha! I wouldn't believe these big figures - you get these when the modem decompression expands a big compressed chunk. The rate that this can be delivered to your 'puter is determined by DTE rather than DCE.

Rare? The TTs are not rare. It's just that in most countries the Atari
was regarded as a game machine. Most TTs were sold in Germany - I
believe there was not enough demand for the machine in other countries.

Cross-posted to: comp.sys.atari.st,comp.sys.atari.8bit

This is your invitation to what is becoming a fun weekly Atari event!

Join us as Atarians from around the world talk about Atari 8-bit
and ST topics simaltaniously.

While I cannot be there personally to moderate the chat, I still
invite you to enjoy the chat room and have fun tonight! I will be with
you, as usual, next Saturday night.

Meeting starts at 8pm CST (If someone could tell me what that
translates to in GMT time, I will use it in future adds.)

http://www.atariusers.com/chat
(Self re-newing chat room page, usually best done with
higher versions of Netscape, Internet Explorer, and even
iCab works good here.)

THOSE WITH CAB TRY THE URL BELOW... WORKS MUCH BETTER!!!

http://www.atariusers.com/cgi-bin/chat/chatform.html
(A variation of the chat room where it does not update
until you press a carriage return. This is good for
earlier versions of Netscape, Cab 2.7 (works great!), etc)

Take care!!

Greg (aka "Doctor Clu")

I have used my Palm with both my TT and Falcon for atleast six months
now. I ported pilot-link from the unix-world, unfortunately it will only
run under MiNT. I've spent quite some time trying to get it to work under
MagiC, but so far without success.

Pilot-link works flawlessy under MiNT though, and since I use MiNT 99% of
the time I haven't done anything to it for three months. If you want a
copy just mail me and I'll send you a copy.

Btw. I've written a "conduit" for aMail, so I can sync email between aMail
and the Palm just by pressing the hotsync-button :-)

Hi Paul,

I have seen something similar to this before.
In my case it has to do with the number of articles you allow for each
newsgroup. For CSAST I have this limited to 750. Now if I already have
700 articles and download 100 more, then I'll get a long number displayed
beside comp.sys.atari.st instead of the actual number of articles that
I have.

One thing you can do is rename the folder for CSAST in the Offline folder
to something else and then create a new folder for CSAST when you see
that downloading a bunch of articles is going to put you over your set
limit.

I do this all the time and works well for me. I don't delete any
Atari news, so about every 2 weeks or so, I'll have to create another
folder to avoid this problem.

I would like to see Newsie store newsgroup articles in one file instead of
a file for each article, as if you keep news like I do, you end up with
thousands of news files. Good thing I have a program that will Merge all
these files into 1 large text file. :)

Also, I think there is a limit or bug in Newsie when you reach around
800 articles for a newsgroup.

>therefore of the air temperature in the machine.

Air coming out of the fan, yes. Air inside the machine, probably no,
because the reading you get will have been augmented by the power
supply, which transfers the majority of its thermal output into
this air stream coming from the fan.

>I know that some
>chips (and especially the '060) get a lot hotter. The reason for
>being interested is that my machine is pushed into a compartment of
>a bookcase behind my desk and I thought the ventilation might be
>impaired. There is about 1 inch clearance at the sides and top.

A confined space doesn't pose a problem so long as the air freely
circulates and is replenished by new, cooler air. Without assisted
circulation, the top of the unit should be allowed as much headroom
as possible, especially as the metal casing also acts as a radiator.

>What sort of air temperature would be expected?

That depends on how many other devices are inside the case.
Storage media mechanisms are the most likely items to be found
increasing operating temperature inside a computer.

>and what would be
>dangerous?

In terms of performance, the cooler the better (PC system builder,
Carrera, is now offering 800MHz AMD Athlon machines, achieved by
an internal refrigeration unit which takes the CPU down to -40
degrees C before allowing the system to power on). The danger
threshold, itself not a clear definition, depends on many factors.
Within a computer there are many different components, all with
varying tolerances to temperature. A chip like the 68060, which is
packaged in a slab of ceramic, can sustain quite high temperatures,
and the "danger" point is really the region where it becomes unstable
as a processor. Other components could melt or burn (this is very

extreme if caused by hot air alone).

For a machine which is switched on and off a lot, the ideal would be to keep as close as possible to equilibrium with the machine's ambient temperature, as it was at power-up time. This would reduce the mechanical stresses induced by thermal cycling, the severity of which in turn depends on the temperature extremes between powered-off and normal running states. Assuming your ambient temperature isn't extremely high or low in the first place...

>I installed a device on the TT which varied the
>speed of the fan according to the temperature but did not have the
>thermometer at that time. It did silence the fan a great deal.

I never believed in those temperature-controlled fans. The main argument was to suprress the noise, and also prolong the life of the fan. Fans are a commodity. With or without this feedback control, the machine temperature stays close to constant, only the constant is higher when you do have a controlled fan because its primary function is to run slower and reduce noise.

My Falcon has three fans and feels cool to the touch, despite having two hard disks, digital audio interface and accelerator board all squeezed into a slim C-LAB MKX case, half-covered by another metal box sitting on top. One of those fans is mounted on the CPU, while the other two draw air in and out respectively, because a single fan either way in a practically closed box is far less efficient.

Hi Jon,

B>I've heard somewhere about getting it work in hi-res monochrome
possible. There is a company in northern Germany who sells an
adapter. I don't know if it works but suppose so.

B>but I want it in colour.
Impossible, I guess.

B>Is there actually much point to doing this or should I get a TT or
B>Falcon (I don't really know which is better).
If you do a lot of music, get a Falcon. I prefer my TT.

B>I would use it for music composition/sampling purposes, so what
B>software/hardware would I need, or again, should I upgrade to a
B>Falcon/TT?
Ok, get a Falcon. :-))

B>How much would a TT/Falcon cost?
Half a year ago I purchased my second TT (just for spare parts) in a
tower with CD rom (4x) two HD flopy drives and a SyQuest 44 meg drive
(11 cartridges) for 500 DM (~ 165 pound sterling). Just to give you an
impression.

B>Is it possible to put the ST in a PC case?
Yes, but you'll need a separate (Mega) keyboard. Sorry, but as the
prices for used STs are very low (at least her in FRG) it's not worth
the work to move it from the original case to a PC case. I think it's
a lot easier to get one PC boxed...

B>I have a Megafile 30; is it SCSI compatible?
It's not SCSI, but MFM or RLL.

B>I can't quite remember but I think someone said it was ACSI. What is
B>ACSI?
ACSI is a subset of SCSI. Again Atari saved some pennies on each ST
motherboard.

B>Is there much point in keeping it or should I upgrade?
You may keep it, but you can't use it with a Falcon! New SCSI disks
are very cheap, but their capacities begin at 6 GB onwards.

But for a real SCSI disk you will need or a Falcon/TT or a host
adapter for any ST.

Und TTschï¿½

> why does this newsgroup have soooo many questions about JUST
> the TT030 computer?

Because the buggiest machine (a.k.a. the Falcon) has been over discussed, over the years, and the ST is abundantly documented.

Seriously, the TT is the best TOS machine ever built. It's fast, rock-solid and has the best expansion possibilities of the whole TOS product line made by Atari.

The only reason why you see so many posts all of a sudden is, a lot of old faithfulls have recently migrated toward the iMac or Linux or BeOS.

This leaves quite many TTs out for grab for very cheap so, many people who dreamed of getting one when it was on a pricier scale get to experience the peculiarities of TT-RAM, TT-High monitors, SCSI terminating resistors, and other similar specialties for the very first time.

I guess this means I should hurry up with the much promised upgrade to my FAQ on the aforementioned TOS powerhouse... :)

Kaosdesk worked fine on an STe, I used it for years, there was even an
upgrade but it still didn't work under TOS 2.06 unfortunately.

Needs an adaptor falcon 2.5" -> 3.5" and IDE wire..
Wizztronics sell some. Ask DOITF030 for other sources and the homebrewed
adaptor. Watch the power what the 3.5" device need!! Falcon internal PSU
isnï¿½t a power pack!

Djordje,
You bring up some good points to look at. Let me add I have access
to two NG servers. One had my follow-up posted then disappeared (along
with the original post) the other still has both listed! Software
problems? Maybe so and I feel lucky we have any software at all!

I do seems to remember having those problems sometime, way back when I use
Newsie to. Can`t recall what I did to coure the problems, but all my problems
disappear, when I lost my SLIP account and had to switch to PPP.

As I wasn`t abel to get STinG to work proberly, I had to get MagiC and I-Connect.
After I got ASH Emailer up and running, I never had the same problems again.

I know,- I know-, you have to have MagiC to use Emailer, but then again,
it works.

cheers

> Nevertheless it was my impression (and this may well be wrong) that
> downloading was quicker with 230400.

Ah, that's better! For modems implementing data compression (just about all) there is a rule of thumb that DTE should be around 3xDCE. Very rough, of course, as it depends on the sort of data you are receiving - graphics usually compresses very well whereas programs and pre-processed images (GIF, JPG etc.) do not. So, if you are getting 44k DCE then 115k DTE is near enough right. As long as you do not start to pick up transmission errors on the DTE section of the pipeline you can stay at 230k. I was doing this once on my TT and found that I was better, overall, dropping to 115k. Much will depend on connector/cabling quality between TT and modem.

> I presume that CAB is clocking the number of bytes _it_ receives per
> second rather than reading the modem output - is this not so?

Dead right! The best measure of system performance is usually got by observing an ftp download of a program file. This PC gets DCEs between 44k and 46k and is limited (!!!!) to 115k DTE - the transfer rate for uncompressible files is around 4.2Kbps.

> Anyway, at the end of the day things are a good deal better and I am
> now tempted to go surfing!

You won't do much better than 44k/230k, John! In fact this combo should be slightly better than on most PCs which limit DTE to 115k. ... unless of course you fancy the cost of ISDN or ASDL.

Yes mate

I have the demo on a site but it is not the latest version . Its still
brilliant though. I ran a BBS under it for two years plus. (The full
version BTW)

I am selling my version though now as I have switched to PC mainly due
to work commitments. I am asking for offers for mine and it comes
with NVDI PC which it really does need to be useful IMHO..

Anyway in the meantime try this URL

This is the site I set up years ago but was never used to the extent
that I thought it would.

http://www.a.taylor.easynet.co.uk

This is the URL for the actual file

http://www.a.taylor.easynet.co.uk/MPCEDEMO.ZIP

This is the correct URL I have now checked the site and the first URL
I gave you does not work since easynet changed the way they alias the
easyweb sites. So as I said I would get back to you and the above
ones work now.

.

I have a lot of experience with Magic PC if you get stuck just shout
as it's not the easiest thing to use AT FIRST. Its the setting up that
is quite awkward after that it's a breeze to use and very very fast
indeed.

Hope this helps.

Well I get 50k6 connections and average 5.2kps download at 56700 on this
Mac. Falcon is about the same and that's only set on 34800.

Hi there!

I've had my Atari Mega ST4 now for about 2 years. I keep on meaning to do something with it, but I never get round to it. What I was wondering was, is it possible to use an SVGA monitor? I've heard somewhere about getting it work in hi-res monochrome but I want it in colour. Is there actually much point to doing this or should I get a TT or Falcon (I don't really know which is better).

I would use it for music composition/sampling purposes, so what software/hardware would I need, or again, should I upgrade to a Falcon/TT?

How much would a TT/Falcon cost?

Is it possible to put the ST in a PC case?

I have a Megafile 30; is it SCSI compatible? I can't quite remember but I think someone said it was ACSI. What is ACSI? Is there much point in keeping it or should I upgrade?

So many questions, I know, but if someone could get back to me on that it would be greatly appreciated.

Thanx in advance,

Jon

Doh!
There's me looking all over the net for it and it's right there in front of me..!!

>Eeeeee 'eck, what am I doing wrong? There's you and Gerry O'Rourke as happy
>as sandboys and me always crashing out at the first attempt to display an
>emulated ST screen!

Here's what happens with me: (Pentium 100, Win98, 24meg ram, ATI graphics card)

Loading Gemulator 98 first time correct found both TOS images I had, a TOS1.62 (tos.img) and MAGIC.RAM (V2.01).

In ST Mono, the emulator runs fine (I installed some of my GFA stuff, and let Ergo!pro preprocess a large source file, and Gemulator ran it about twice as fast as my STE). Normal ST colour resolutions also work as expected.

However, any attempts (including both screen drivers in the Gemulator package) to get a larger screen result in a garbled window. I'd *really* like to be able to get an 800x600 (or bigger) screen running in at least 16 colours, but so far I'm unable to get anything other than the standard ST resolutions. I will try some other TOS images and continue to play with it.

Of course, even ST Mono running in a stable manner is fantastic, but if I could just get a larger screen...

Okey Dokey,

From the responses I've received no one seems to mind if I post my stuff here.

In the next couple of days I'll get a list together and post it. It probably won't be complete (e.g. every single cable or chip may not get listed) but I'll do the best I can. If anyone buys everything they get everything even if it's not on the list. If anyone wants specific information (e.g. motherboard revision) let me know.

I received a couple of posts about specific applications. All I can say is I have no idea. I haven't used the Ataris for several years. If you want to know what the capabilities of current software is ask someone here.

Source record: 71675

Hello;

I'm looking to purchase an Atari STFM. This will be my first 16-bit Atari. I've already sourced a few, but had a couple of questions before I went any further.

I've looked everywhere but cannot find any information on which kind of Floppy Drive comes with them, 360 or 720. Also, do they require an older (switchable) RF unit, or a newer (Nintendo-style) automatice one?

Could someone please help? Thanks in advance for any replies.

/eric

1181. megafile 30 on mega st 1

Newsgroup: comp.sys.atari.st

Hi all,

I was trying to connect a megafile 30 to a mega st 1. The machine does
neither boot from the HD nor does it appear in the desktop.
What may be wrong? what software would I need to resurrect the combo?

Thanks in advance, Robert

** To reply in e-mail, remove "sijpep." and ".invalid" from address **

I wish you would have this on IRC as opposed to those terrible html based chat sessions that take place on the WWW. Or maybe ICQ. I still use IRC but have not caught on to ICQ really. Anyhow it seems to me for such a chat group to survive someone has to advertise it and make it happen which it looks like you are doing. More power to ya!

1184. STE - lots of questions

Newsgroup: comp.sys.atari.st
Date: 1999-10-24 00:00:00 UTC
From: Hellraiser <justin@hellraiser.nospam.demon.co.uk>
Message-ID: <940795891.27729.0.nnrp-09.c2de4101@news.demon.co.uk>
Source record: 71679
Cross-posted to: comp.sys.atari.st,comp.sys.atari.st.tech

I've recently got a 520STE, basically just to have a bit of nostalgia and play some of the classic old games, such as Dungeon Master, but I have a few questions:-

1) Are there any major compatibility issues with the STE? I seem to remember a few, but this was quite some time ago.

2) Is there any way of adding a hard disk to an STE?

3) Or how about a CD?

4) I have a CD containing numerous disk images of ST games. Now, I realise I can use something like Makedisk to dump these images onto floppy, but this would be a bit slow. Is there any way I can get the ST to treat one of these images as, say, drive A? I mean, link the ST to the PC by the parallel port for example, and use a device driver for it. Does anything like this exist?

5) How picky is the STE about the 30 pin SIMMS it accepts? A friend has a few pulled out of an old 486, but I'd like to know if they are likely to work.

6) I know there are loads of sites with disk images of games, etc, on, but are there any with disk images of utils disks, with stuff like Assempro, Devpac, Fast Basic, that sort of thing? I can get hold of the originals of most of these, but having been left in a cold, damp loft for the best part of 7 years, most of them no longer work :-(

7) And finally, what is the maximum baud rate you can drive the ST's serial port at?

Sorry if this goes on a bit, but I thought I'd get all the questions out in one go!

Cheers

Justin

1185. Cheap ST Games for Sale

Newsgroup: comp.sys.atari.st
Date: 1999-10-24 00:00:00 UTC

Atari Games for Sale !!!!!!!

E-mail : oscar@agra.globalnet.co.uk

Work in all ST/STFM/STE Machines.

NOTE : All prices (noted with the symbol #) are in UK pounds
NOTE : All games are original, NOT copies !

** OFFER : Buy #10 pounds worth of gear and get any single game FREE

List of Productivity Software/Hardware : (#7 each + shipping in pound
sterling)

---
* Devpac III
* STOS Maestro Plus (Hardware Sampling cartridge and software included)
* PC SPEED v1.5 (Hardware and software - requires soldering - ST only)

List of Compilations :(#4 each game + shipping in pounds sterling)

** (ALL BOXED + MANUALS + ORIGINAL DISKS) **
* Giants
(includes Outrun, Gaunlet II, 1943 and Street Fighter)
* Quatro Sports
(includes BMX, Italia 90, Advanced Ski and Pro Tennis)
* Magnetic Scrolls Collection (1 Meg required)
(includes Fish, Corruption and Guild of Thieves)

List of Games : (#3 each game + shipping in pound sterling)

(ALL BOXED + MANUALS + DISKS)
* Baal
* Batman
* Deja Vu
* Driller
* Elite
* F-19 Stealth Fighter
* Falcon (Game + Mission Disk Vol 1)
* Galdregons Domain
* Ghouls 'n' Ghosts
* Gods
* Gold Rush
* Heimdall (1 Meg)
* Hook (1 Meg recommended)
* King's Quest II

* King's Quest III
* Quadralien
* Leader Board (Game + Tournament Disk Vol 1)
* Leather Goddesses of Phobos
* Lotus Esprit Turbo Challenge 2
* Magic Pockets
* Midnight Resistance
* Midwinter
* Navy Seals
* Night Breed
* Operation Wolf
* Purple Saturn Day
* Premier Manager 2
* Rick Dangerous
* Robinson's Request (1 Meg)
* Shadow of the Beast
* Sly Spy - Secret Agent
* Space Quest II
* Space Quest III
* Spy vs Spy (Artic Antics)
* The Patrician (1 Meg required)
* The Quest for the Time Bird
* Transartica
* Uninvited
* Zool

List of Games : (#2 each game + shipping in pounds sterling)

(NOT BOXED ONLY ORIGINAL DISKS + MANUALS)
* Another World
* King's Quest IV
* Leisure Suit Larry II
* Leisure Suit Larry III
* Operation Stealth
* Police Quest II
* Secret of the Monkey Island
* Storm Master
* Street Fighter II
* The Godfather III (Action Game)
* Wonderland

List of Games : (#1 each game + shipping in pounds sterling)

(NOT BOXED, (1)NO MANUALS, (2)ONLY ORIGINAL DISKS)
(1)Manuals are not really needed to play these games anyway
(2)Original Disks, we do not sell pirated software,so don't even ask.
* Alien Syndrome
* Crystals of Arborea
* Hard Drivin'
* Indiana Jones and the Last Crusade (Action Game)
* Oil Mania

* Panza Kick Boxing
* Rock 'n' Roll
* Silk Worm (Boxed but no manual)
* Spitting Image
* Strider
* The Hitchhiker's Guide to the Galaxy
* Trinity
* Trivial Pursuit
* Wrestlemania

From version 2.2 GEMTrade supports a user dictionary to allow words to be added to the dictionary. This user dictionary is searched before the main one, so it can be effectively used for alternative translations too.

Mark.

Without special hardware, that would only give you 4 colours at
640x200 or 16 colours at 320x200 ... and even then, you'll need a
special adapter. I think Mario Becroft sells one.

> I've heard somewhere about getting it
>work in hi-res monochrome but I want it in colour. Is there actually much
>point to doing this or should I get a TT or Falcon (I don't really know

If you really want modern colour, you probably want a Falcon.

>
>I have a Megafile 30; is it SCSI compatible? I can't quite remember but I
>think someone said it was ACSI. What is ACSI? Is there much point in keeping
>it or should I upgrade?
>

The Megafile 30 has an ACSI interface, but contains an ACSI-to-SCSI
"host adapter" (converter) and either (I'm not sure):
1. a SCSI-to-RLL converter and an RLL drive, or
2. a SCSI drive.

If you don't mind taking things apart, you might want to keep the case
and buy a replacement bare SCSI drive. The Falcon has SCSI output, so
if you get a Falcon, you can throw away the ACSI-to-SCSI host adapter.

>So many questions, I know, but if someone could get back to me on that it
>would be greatly appreciated.
>

You're welcome ... hope someone can help out on the music side.

Hi guys,

Well, I got a copy of TOS 2.06 and lo and behold: big screens now work!

ST Mono resolutions work nice and fast - I did 800x600 no problems.

The colour resolutions also work, although are a lot slower (again, some fiddling with the parameters is probably necessary), but I do have a fairly slow PC by modern standards.

So, it can be done!

Perhaps one of these unanswerable questions but I was correspoonding with someone and said to him that a thermometer probe on the external casing of the cooling fan of the Hades was reading 38 degrees centigrade (it is now 39.5). During the summer it would get to over 40. He thought it was a little high.

I stuck the probe there as I assumed that it would reflect fairly accurately the temperature of the air coming out of the fan and therefore of the air temperature in the machine. I know that some chips (and especially the '060) get a lot hotter. The reason for being interested is that my machine is pushed into a compartment of a bookcase behind my desk and I thought the ventilation might be impaired. There is about 1 inch clearance at the sides and top.

What sort of air temperature would be expected? and what would be dangerous? I installed a device on the TT which varied the speed of the fan according to the temperature but did not have the thermometer at that time. It did silence the fan a great deal.

You're right. Sorry, I don't use Usenet much - and the private UK conferencing CIX (www.cix.co.uk, come on in, it's great!) I normally use has MUCH better threading than poor old Usenet.

I think the best way to publicise such machines, though, is to call them ST-compatible, as that is surely the machine most people will know about.

After all, it's not calling them "ST clones", which implies they are copies and no better than the original.

: John

How is the disc damaged? If the filesystem is damaged (owing to physical disc damage or a software malfunction) you may still be able to retrieve the data manually if you know what you are doing. If part of the disc is physically damaged there is probably no way to retrieve the data that was stored there, but that may not stop you from retrieving data that was stored elsewhere on the disc.

There are tools such as Diamond Edge which can automatically repair simple errors but otherwise you need to do it by hand with a disc editor.

Wait a moment! <f/x: starts Mac>

Meanwhile...

> Of course. But anyway: It is not an emulator. 8-)

I've been having this argument on CIX, too. Why not? It runs under another OS, it cannot boot natively on the hardware, and it exists so that you can run software from another computer on a Mac that could not normally run that software.

That is almost a definition of an emulator!

Can anyone point me to a current version of the Magic-PC demo for download? I can't find any links on ASH's page, but my German is VERY bad.

Ah, the Mac's up! Now, where did I leave Magic? <Search> Hell, I've deleted it. Oh, well.

> work in hi-res monochrome but I want it in colour.

Sorry, colour won't work unless you have a mutisysnc capable of dropping
50Hz, ie TV refresh rates, as ST colour modes are aimed at outputting to
TVs. ST-high (640*400, 70Hz, monochrome) is best for serious work anyway.

> Is there actually much
> point to doing this or should I get a TT or Falcon (I don't really know
> which is better).

If you want decent colour resolutions you need either a Falcon or a TT with
a graphics card (TT without a graphics card is still pretty limited)

> I would use it for music composition/sampling purposes, so what
> software/hardware would I need, or again, should I upgrade to a Falcon/TT?

For music go for the Falcon if you want to do hard disc recording etc,
otherwise the Mega will do the job. However, most Atari music software (eg
non-audio versions of Cubase, Notator etc) tends to only work in ST-high or
other monochrome modes (eg TT-high) anyway, so colour is less important than
you might think. For MIDI, Cubase or Notator are the main packages. For
sampling, I'm not sure about software..

> How much would a TT/Falcon cost?

No idea, but machines are offered for sale in this group quite regularly.

> Is it possible to put the ST in a PC case?

Yes, special kits were available, others may be able to point you in the
direction of details for doing it yourself with standard parts.

> I have a Megafile 30; is it SCSI compatible? I can't quite remember but I
> think someone said it was ACSI. What is ACSI? Is there much point in

> it or should I upgrade?

It's ACSI, not SCSI compatible AFAIK. ACSI is Atari's cut-down version of
SCSI: you can use SCSI drives with the addition of a host adaptor such as
the Link (best to go for a Link II or Link97 as these work with more
drives). You'd probably be better upgrading to something bigger. Both the

Falcon and TT have proper SCSI ports.

> So are you saying that it'l be a one stop translater with the user
> having the choice of Ger --> english or fr --> english?.

Yes. But it will translate in any direction so you get...

German -> English
German -> French
English -> German
English -> French
French -> German
French -> English

After this initial hurdle, the challenge will be in trying to improve the grammer in all these options... :-)

Plus - GEMTrade 3.0 will work as a spell checker in English, French and German. When used with something like Everest and OLGA, save the text file, GEMTrade automatically spell checks it and the result is reloaded in Everest! And... because GT already supports HTML, the content within tags if you're working with HTML pages won't be reported as being mis-spelt! Useful?

> Will you annuonce this when it available?.

Yes. :-)

Mark.

Why not make an Atari version of Netscape since the source code is
available?

Joshua.

>
> I'd disagree with that. You certainly won't get the most out of the
> computer on a TV.

I didn't say you would, only that ST colour modes run at TV refresh rates so
that they *can* output to TVs. This was important when they first came out
as pretty much all home computers could output to TVs at the time. I
entirely agree that everything is clearer on a proper colour monitor, but
most modern monitors won't drop down far enough - you really need a proper
RGB monitor or one of the rare multisyncs that will also display ordinary
video (which is what the STs output: NB I'm referring to the monitor output,
not the RF which is ordinary video modulated so you can plug it into the
aerial socket on the TV rather than the video in). This is why the VGA
adaptors for STs only offer ST-high.

> It is also possible for the ST to run at 60Hz, which is needed to
> display some pictures. Some older TV's don't like the 60Hz rate, but I
> haven't come across any Atari colour monitor (and I've had a few) that
> couldn't cope with it!

60Hz is available as it's the North American standard for AC mains and hence
TV refresh rates (this goes back to the days before TVs used chips to
generate the scan frequency; they originally used the mains frequency,
AIUI). Newer TVs are happy with both rates as they use the same chip for all
versions sold worldwide. Which is how some UK videos can play back (but not
record) NTSC (US) tapes on the cheap: they rely on the TV handling 60Hz and
don't provide any kind of scanrate converter.

Some games don't like STE.
>
> 2) Is there any way of adding a hard disk to an STE?

Same as with ST. External unit like Megafile, or SCSI host plus standard
SCSI drive. Some STE have defective DMA chip that scrambles hard drive.
Atari offered free replacement, but some non-hard drive users didn't
know they had bad chip.
>
> 3) Or how about a CD?

Add via SCSI host and driver software like ExtenDOS

Just happened to see part of a commerical on TV this evening that was advertising a new Tetris game called "The Next Tetris" IIRC.

Anyway at the end of the commercial it was said that the game was from Atari and sure enough there was the Atari logo.

Whats up with that? Is Hasbro using the Atari name to advertise games?

1) PARTS of netscape only are available in src code (mozilla it would be,
the free one which is not netscape navigator src (afaik))
2) netscape src are written X11 in mind. (you have X11 on your atari?)
3) Netscape wouldn't work well at all in 4meg of ram and a 8mhz cpu.
Netscape on linux with 48meg of ram installed just crawls with constant
swapping on the p133.
4) One OS would have to be choosen, unless there should be 3 ports of
netscape? one for singletos, one for mint and one for magic?
5) WHat stack will be be made for? MiNTnet would be the closest thing I
could think of, but I am sure then magic people with iconnect would be
mad? what about stik? or wensuite internet API?

Anyway, talking about netscape is not a realistic way to handle the web
browser problems we might have.

MGI only released Calamus 95 for the PC - they were working on an update and then stopped development in late 98. The current version of SL 99 is available in either a TOS/MagicCMac version or with an embeded emulator for PC's. On a farily fast PC (say 300 mHz or higher) it runs as fast or faster than a TT.

My ISP server was down - you were going to post how to correctly set up Gemulator (something which I have had great difficulty with) - did I miss your post?

Can you help?

1214. Re: Gemulator Setup that works (was RE: Emulators)

Newsgroup: comp.sys.atari.st
Date: 1999-10-25 00:00:00 UTC
From: Ben Hall <benj@seriously-productions.freeserve.co.uk>
Message-ID: <7v0662$hq0$1@news8.svr.pol.co.uk>
Source record: 71599

Incidentally, I have a few Zip disks formatted by my Atari - is it possible for Gemulator to read them? (I haven't had any joy so far, the disks just come up as if they were blank, exactly as they do under W98)

It will access normal PC formatted Zips (via a parallel Zip) under Gem in the normal way, but it would be *fantastic* if I can access Atari-formatted Zips directly.

Thanks!

Atari TOS history v1.03

Historical versions - TOS/GEM
==========

OS: TOS [The Operating System]
Vendor: Atari
Version: 1.00
Machines: 260/520ST
Comments: Initial release. Fairly buggy; only used for compatibility with older programs. Desk accessories must be named DESKn.ACC. Loaded from disk, so also known as "RAM TOS" or "Disk TOS".

OS: TOS
Vendor: Atari
Version: 1.00
Machines: 520/1040ST
Comments: First ROM release. Updated GEMDOS and AES. AKA "Old TOS", "ROM TOS".

OS: TOS
Vendor: Atari
Version: 1.2 (later renumbered 1.02)
Machines: 520/1040ST/STF/SFM/STFM, Mega ST 2 and 4
Comments: First ROM-only version. Bug fixes; support for DMA/Blitter and real-time clock chips. AKA "Blitter TOS", "Mega TOS".

OS: TOS
Vendor: Atari

Version: "1.09"
Machines: 520/1040ST/STF/SFM/STFM, Mega ST 2 and 4
Comments: Incorrectly-reported number for UK version of 1.(0)2.

OS: TOS
Vendor: Atari
Version: 1.4 (later 1.04)
Machines: Stacey laptop (1st release); later on 520/1040STFM, Mega ST 1/2/4,
Comments: Most common version of TOS; last version to run on pre-STe machines; most compatible with games. More bug fixes (e.g. archive attribute works); improved hard-disk handling and performance. Faster disk copy; file move function; copy preserves date/time stamps; folder renaming; auto-run of GEM apps at startup; larger screen support; file "fastload" flag for faster startup; improved file selector; DOS-compatible disk format; keyboard reset. AKA "Rainbow TOS" because of animated colour Atari "Fuji" logo in desktop "About" dialog box.

OS: TOS
Vendor: Atari
Version: 1.6
Machine: 1040STE
Comments: As 1.(0)4 plus support for the enhanced STe. (Up to 4,096 colours; 8-bit stereo DMA sound; light-gun/paddle; external Genlock; hardware scrolling; 68030 processor; etc.) Mouse support in "show file to screen" function; 4-bit colour values; disk boot-up delay. Bug fixes. AKA "STE TOS".

OS: TOS
Vendor: Atari
Version: 1.62
Machine: 1040STE
Comments: As 1.6 plus bug-fixes, including of 1.6's failure to save selection of medium resolution correctly in DESKTOP.INF.

OS: TOS
Vendor: Atari
Versions: 2.02, 2.05, 2.06
Machine: Mega STE
Comments: Last version of Atari TOS for the 68000 line. Many bug fixes. Atari logo display at boot-up; automatic cold boot memory test. "NewDesk" desktop gains features from Gribnif's NeoDesk, including: definable keyboard shortcuts; install programs/files/folders as icons on desktop; install all available drives with one operation; automatic fitting of icons to window; configurable desktop and window colours, file and device icons; single-operation copy/move and rename; windows scrollable while files selected; "select all" command; programs startable with function keys; bypass program autostart by holding down Control key; enter special characters with Alt-[numeric keypad] combinations; file search function; file masks support; multiple desktop configurations; directory list printing; unsorted view; resolution change with

Alt-[number]; 7 windows allowed; bring-window-to-top function. Friendliest and most stable version, but loses compatibility by fixing bugs and changing undocumented features from v1.(0)4 that were used by older software. Preferred choice for serious ST use. AKA "Mega STE TOS".

OS: TOS
Vendor: Atari
Version: 2.08
Machine: STbook
Comments: Special version for 1992 notebook ST. ROM also contains some notebook-specific utilities: STTRANS (null-modem/ parallel-cable data transfer), power management tools, hard disk drive tools and drivers (AHDI, XHDI, BOOKINST and BOOKFMT) and a RAMdisk installer.

OS: TOS
Vendor: Atari
Version: 3.01, 3.05, 3.06
Machine: TT
Comments: TOS 3.0x was released (for the 68030-based TT) before 2.0x; TOS 2 was essentially a version of TOS 3 for older hardware. Feature parity was achieved with versions 2.05/3.05. Supports higher resolutions, fast "TT RAM", 1.4MB diskettes, 6ms step rate, better media-change detection. Adds GTP program support (GEM-Takes-Parameters), XCONTROL panel accessory, individual colouring of all window elements. Bug-fixes. ROM size grows from 256KB to 512KB. AKA "TT TOS".

OS: TOS
Vendor: Atari
Version: 4.00, 4.01, 4.02, 4.04
Machine(s): Falcon
Comments: New version for the Falcon. 68030 only. Adds support for DSP, 16MHz blitter and video overlay. New v3.40 AES (last single-tasking version, but MiNT/MultiTOS-multitasking-aware) supports: and pop-up menus; 3D window and dialog objects (later modified to to use more compatible ob_state flags instead of extended type); 256-colour "animated" icons; soft-loaded fonts; inter-app drag&drop; background window manipulation; extensible filesystems. New CPX module for international localisation configuration. V4.04 was the last official Atari version of TOS. AKA "3D TOS".

OS: TOS
Vendor: none (developed by Atari)
Version: 4.92, 4.98
Machine(s): Never officially released; distribution illegal
Comments: Bug-ridden internal developer version, but sometimes offered for download. Would have become TOS 5.0, "Falcon TOS".

OS component: MiNT [MiNT is Not (later, "Now") TOS]
Vendor: Atari
Version: 1.09 (last Atari version of MiNT)
Machine(s): All STs and compatibles
Comments: BSD Unix-based pre-emptive multitasking/multiuser kernel

originally developed by Eric R. Smith. Replaces GEMDOS - provides process/memory management, filesystem I/O etc.; requires AES, VDI and desktop.

OS: MultiTOS
Vendor: Atari
Version: 1.04 (1.08 in unreleased beta)
Machine(s): Falcon (but runs on all STs and compatibles)
Comments: Official Atari version. Extension to TOS 4: MiNT kernel + (very slow) multitasking v4.1 AES (AKA "MultiAES".) Runs on 68000, but requires 68030 for memory protection.

OS: Kaos TOS
Vendor: Andreas Kromke
Version: 1.4.1
Machine(s): All STs and compatibles
Comments: Early single-tasking GEM-compatible TOS replacement, based on TOS 1.4. Two versions: on ROM, "KAOS030", and a disk-loaded version supplied with its own desktop, KaosDesk. Faster and less bug-ridden, but incompatible with TT and Falcon. Supplied with some 60030 accelerator boards. Development stopped after release of TOS 2.06. Some parts (such as MCMD CLI shell) reused in MagiC, developed by the same author.

Historical versions - extensions
================================

OS: MultiGEM
Vendor: Maxon
Version: ***?***
Machine(s): All STs and compatibles
Comments: Co-operative multitasking GEM extension (c.f. Geneva). Two versions were available. Development stopped after release of MultiTOS and MagiC.

OS: ABC GEM
Vendor: ABC Software Holland
Version: 2.2
Machine(s): All STs and compatibles
Comments: Port of PC GEM/2 for ST series. AES and VDI replacement (much faster VDI than TOS 1.04). Uses GEMDOS of built-in TOS. Integrated ABC-GDOS offers minor enhancements, but won't run on CPU >68000.

OS Component: Teradesk
Version: 1.40a
Vendor: ***?***
Machine(s): All STs and compatibles
Comments: Replacement desktop for TOS. Freeware. Included multitasking support. Compatible MagiC, possibly MiNT/MultiTOS too. Incorporated many features from TOS 2.x, including icons on the desktop, drag and drop to desktop icons, configurable command lines for apps requiring switches etc. Included its own file viewer for viewing text files in windows (vast improvement over TOS file viewer). Development

stopped, so no support for long file names or newer system features.

OS Component: GDOS
Vendor: Atari
Version: ?
Comments: Original GDOS from Digital Research, ported from PC GEM/1
GDOS. Supplied with some GEM applications and the Atari laser printer.
Distribution stopped with release of FontGDOS.

OS Component: AMC-GDOS
Vendor: AMC
Version: ?
Comments: Slightly better, faster GDOS; some bugfixes. Distributed
with AMC software and later under license by Atari (at least in Germany)
together with the original GDOS.

OS Component: G+Plus GDOS
Vendor: CodeHead
Version: ? (1988/1989)
Comments: Commercial. Slightly better, some bugfixes.

OS Component: FontGDOS
Vendor: Atari
Version: 2.0
Comments: Supports TT screen resolutions; bitmap caching; better RAM
usage (fonts loaded on demand); GEM/3 Bezier curve VDI routines; more
printer drivers, including HP Deskjet, HP Paintjet, Okidata Color,
Epson-compatible 24-pin B/W and Colour; easy on-the-fly changing of
printer drivers; easy selection or installing of other GDOS drivers.

OS Component: FSM (Font Scaling Mechanism) -GDOS
Vendor: Atari
Version: 3.0
Comments: Parallel development with FontGDOS; never independently
released, but available in bundles. Supports Imagen Outline Font format.

Current versions; under active development
==========

OS: TOS
Vendor: Milan Computer GmbH
Version: 4.07 (website reports 4.5) [as at Oct 1999]
Machine(s): Milan
Comments: Debugged version of Atari TOS supplied with Milan
ST-compatibles. Adds MagiC-compatible extended objects (e.g. crossbuttons,
checkbuttons, frames).
Website: http://www.milan-computer.de/

OS: MultiOS
Version: 1.2 [as at Oct 1999]
Vendor: Milan Computer
Machine(s): Milan
Comments: Bundle comprising FreeMiNT kernel (q.v.), N.AES and

N.Thing desktop; uses TOS 4.5 VDI.
Website: http://www.milan-computer.de/

OS: MagiC [formerly Mag!X or MagX]
Version: 6.1 [as at Oct 1999]
Vendor: Application Systems Heidelberg
Machine(s): All STs and compatibles; under emulation on Windows and MacOS
Comments: Commercial TOS-compatible reverse-engineered OS for ST/TT/Falcon & compatibles. Replaces GEMDOS, VDI, and AES. Has own desktop (MagXdesk) but also works with other replacements. Supports both pre-emptive and co-operative multitasking, threads, long filenames, large disks. Supports editable window gadgets via resource file (WINFRAME.RSC), enabling creation of desktop themes. Adds some GEM/2 functions but does not support all functions of 3.40 and 4.1 AES. Integrated desktop (MagXdesk) has many additional features such as dynamic loading/unloading of accessories.
Website: http://www.application-systems.de/magic/

OS component: FreeMiNT
Version: 1.15.4 beta [as at Oct 1999]
Vendor: Free GPL software
Machine(s): All STs and compatibles
Comments: Open source version of MiNT, released by Atari after withdrawal from ST market
Website: http://www.cs.uni-magdeburg.de/~fnaumann/mint/ (source code)
ftp://ftp.stochastik.rwth-aachen.de/pub/atari/sparemint/ (SpareMiNT home)

OS component: N.AES
Version: 2.0 [as at Oct 1999]
Vendor: Woller Systeme
Machine(s): All STs and compatibles
Comments: Commercial replacement for Atari v4.1AES. Runs on MiNT. Currently most useful AES for MiNT.
Website: http://www.woller.com/

OS component: Geneva
Version: 006 [as at Oct 1999; may be a German-only v007]
Vendor: Gribnif
Machine(s): All STs and compatibles
Comments: Commercial multitasking replacement for Atari v4.1AES. Runs on MiNT or TOS. Works best with multitasking-aware desktop such as NeoDesk, but can be used without desktop via extended file selector. Adds keyboard control to GEM menus and dialogs; GEM.CNF startup script; dynamic loading/unloading of desk accessories;
Website: http://www4.pair.com/gribnif/

OS component: NVDI
Version: 5.0 [as at Oct 1999]
Vendor: Behne & Behne Systemsoftware GbR

Machine(s): All STs and compatibles, and under emulation on PC and Mac
Comments: Commercial replacement for VDI and GDOS. Works with MiNT, MagiC, TOS. Much faster. Commonly used for professional ST work. On machines with special graphics accelerators hardware (e.g. Milan's S3 card), calls ROM VDI graphics driver. Integrated NVDI-GDOS supports Speedo, TrueType and PostScript Type 1 vector fonts.
Website: http://www.nvdi.de/gb/NVDI5.html

OS component: oAESis
Version: 0.90 [as at Oct 1999]
Vendor: Free GPL software
Machine(s): All STs and compatibles
Comments: As-yet unfinished project to create a free AES for FreeMiNT.
Website: http://www.nocrew.org/osis/oaesis/

OS component: fVDI
Version: 0.95beta [991016]
Vendor: Free GPL software
Machine(s): Drivers available for normal Atari 1/4 bitplanes, FalconTC and Eclipse/RageII
Comments: Nearly-complete replacement for original VDI/GDOS with some of the later extensions, such as Bezier curves/areas.
Website: http://rand.thn.htu.se/

OS component: XaAES
Version: beta7+ [March '99]
Vendor: Free software (GPL?)
Machine(s): All STs and compatibles running MiNT
Comments: Preemptively multitasking AES. 'Officially' dead, but worked on from time to time.
Website: None known (original site disappeared)
Latest beta at ftp://rand.thn.htu.se

OS Component: SpeedoGDOS
Vendor: Initially Atari, later Compo Software
Version: 4.1 from Atari; 5+ developed by no Software. V5.5 current as of Oct 99
Comments: Commercial. Supports Speedo vector fonts, and since v5 TrueType and Postscript Type 1 too. (A special version, 4.2, was released for the Papyrus word processor.)

OS Component: Jinnee
Version: 2.0
Vendor: Application Systems Heidelberg
Machine(s): All STs and compatibles
Comments: Replacement desktop. Runs on TOS and MagiC. Borrows features from MacOS 8 (such as spring folders and pop-up windows) and Windows Explorer. Supports: placing icons on the desktop; symbolic links; long file names; hotkeys for applications, even from within other apps; association by file-type or wildcards; dynamic loading of desk accessories; desktop sticky-notes; file undelete from the trashcan;

intelligent window placement; selection of files by typing the first few characters of the name; selectable desktop backgrounds and sound effects; removable media ejection.
Website: http://www.application-systems.de/jinnee/

OS Component: NeoDesk
Version: 4
Vendor: Gribnif
Machine(s): All STs and compatibles
Comments: Replacement desktop for TOS. Supports multitasking if used with Geneva, but does not require it. Adds: program groups; background file copy/move, disk formatting; menu bars within windows; operation of the desktop within a window or as a desk accessory; command-line interface and macro language; recoverable trashcan; control panel; screen savers; icon editor with Windows .ICO import; desktop notes; file clipboard (holds files in RAM); directory sorting; desktop background patterns and wallpapers; split windows with multiple views; colours/fonts/icons selectable on a per-window basis; non-modal dialogs;
Website: http://www4.pair.com/gribnif/neodesk.htm

OS Component: Thing
Version: 1.27e
Vendor: Thomas Binder
Machine(s): All STs and compatibles
Comments: Replacement desktop. Adds: 3D look; file cut/copy/paste; case-sensitive sort; apply button for settings changes; contextual menus; removable media eject option; TrueColour support.
Website:
http://www.cix.co.uk/~inactive/inactive/software/thng120.htm

OS Component: Gemini
Version: 1.A
Vendor: Stefan Eissing
Machine(s): All STs and compatibles
Comments: Replacement desktop ("Venus") tightly integrated with a console-window CLI ("Mupfel", a version of UNIX ksh).
Website: http://user.tninet.se/~gcc561r/desktops/gemini.html
http://www.muenster.de/~reschke/soft_e.html

OS Component: Ease
Version: ***?***
Vendor: ***?***
Machine(s): All STs and compatibles
Comments: Replacement desktop. Bundled with early version of MagiC.
Website: ***?***

1216. Re: Gemulator Setup that works (was RE: Emulators)

Newsgroup: comp.sys.atari.st
Date: 1999-10-25 00:00:00 UTC
From: Ben Hall <benj@seriously-productions.freeserve.co.uk>
Message-ID: <7v0c4bdtr1@news5.svr.pol.co.uk>
Source record: 71601

Ah, emulators.com to the rescue again!

While Gemulator Explorer won't let Gemulator
itself read Atari formatted Zips, it *will* let
windows read it so I can at least access these
and copy files off of them, which is wicked!

(I just had Calamus SL running at 1024x768 on
effectively a turbo charged 14 meg ST.
Amazing!)

> 1) Are there any major compatibility issues with the STE? I seem to remember
> a few, but this was quite some time ago.

Some games are directly made for STe machinces, but other ones should
also work finde.

> 2) Is there any way of adding a hard disk to an STE?

DMA (Megafile)
DMA to SCSI Adaptor (LINK Adaptors)
Internal IDE Interface

> 3) Or how about a CD?

Same way. External, DMA to SCSI Adaptor..

> 4) I have a CD containing numerous disk images of ST games. Now, I realise I
> can use something like Makedisk to dump these images onto floppy, but this
> would be a bit slow. Is there any way I can get the ST to treat one of these
> images as, say, drive A? I mean, link the ST to the PC by the parallel port
> for example, and use a device driver for it. Does anything like this exist?

I never hear about that and how it works.

> 5) How picky is the STE about the 30 pin SIMMS it accepts? A friend has a
> few pulled out of an old 486, but I'd like to know if they are likely to

Best way the simm had the same technical data as the simm what the
machine contain. Watch atari memory bank groups. So i can remeber me
that these STe2 must be upgraded bank wise..

> 6) I know there are loads of sites with disk images of games, etc, on, but
> are there any with disk images of utils disks, with stuff like Assempro,
> Devpac, Fast Basic, that sort of thing? I can get hold of the originals of
> most of these, but having been left in a cold, damp loft for the best part
> of 7 years, most of them no longer work :-(

You are sure these sides are free, or they all piracy sites?
Maybee, damaged disks canï¿½t bee reanimated. Needs a long time to pick up
working parts from any disk and you canï¿½t got all data.
Iï¿½m not sure anybody put these utilities to the web.
Mostly these sides contain games..

> 7) And finally, what is the maximum baud rate you can drive the ST's serial
> port at?

19K2 without HSModem, without Hardware modification.
Save an old 520ST here, this machine contains "RS-Speed" so i have a
maximum serial baud rate of 115K2. But MagiC runs, als example, itï¿½s
better to go down with the baud rate. (CRC-Errors with MagiC)
With single tos and coNnect 2.46, fine to use.

> I was trying to connect a megafile 30 to a mega st 1. The machine does
> neither boot from the HD nor does it appear in the desktop.
> What may be wrong? what software would I need to resurrect the combo?

Normaly connect the drive, use ahdi as driver (setup the drive)
Install one drive icon for each partition on desktop, save desktop.inf
Create autofolder on part. "C"

Maybee you have troube with internal DMA Chip, machine must "see" the
drive perfectly. Do not disconnect DMA cable while the units are ON!

>Sorry, colour won't work unless you have a mutisysnc capable of dropping
>50Hz, ie TV refresh rates, as ST colour modes are aimed at outputting to
>TVs.

I'd disagree with that. You certainly won't get the most out of the
computer on a TV. If you have Railroad Tycoon you will struggle to see
where the signals are at the stations, on a colour monitor you can see
the signal and the colour. Also a colour monitor is easier on the eyes.

It is also possible for the ST to run at 60Hz, which is needed to
display some pictures. Some older TV's don't like the 60Hz rate, but I
haven't come across any Atari colour monitor (and I've had a few) that
couldn't cope with it!

> ST-high (640*400, 70Hz, monochrome) is best for serious work anyway.
>

Yep! hi-res is easier on the eyes for productivity purposes:)

I'd recommend installing NVDI instead. Not only will it give you much faster screen updates, it will also give you access to Truetype, Speedo and Postscript fonts and a unified printer driver system (for progs which support it).

Much better and easier than a blitter IMO.

: 640x200 or 16 colours at 320x200 ... and even then, you'll need a
: special adapter. I think Mario Becroft sells one.

With my adapter the only resolution available would be ST High, 640x400 pixels in monochrome.

To use lower resolutions you would need an expensive scan converter that buffers the image and outputs it at the higher scan rate required by a SVGA monitor.

Hi
In Brighton UK
I have a Falcon 030 14 meg, with monitor and 1gig System Solutions MiniS for sale. With the computer I also have a full boxed copy of Falcon Cubase Audio, complete with FDI and Analogue 8 interfaces.
I have also a spare mono monitor.I am willing to sell separately if necessary.
I am unaware of the current second hand worth of Aatari hardware, so I am unable to give a price but I will consider any offers I receive that seem reasonable.

Sorry? Maybe just use the wrong software, as Usenet has threading,
though there's a lot of broken software out there that doesn't use the
threading information found in the "References:"-Header when displaying
a group (often), or doesn't include the correct references for new
postings that are replies to existing ones (this isn't found that
often). AFAIR, Newsie falls under both categories, but I may be wrong.

Ciao

Thomas

The largest heat generator will be the power supply and then possibly the processor, though I'm not sure about the processor, all the other IC's will probably at the ambient outside temperature as they should not comsume enough power to produce any significant heat themselves, for a true reading of the ambient internal temperature the temperature probe should be in free air (not touching any components) and midway detween the main heat sources and fan as possible

>What sort of air temperature would be expected?

Not sure, I suspect that the power supply would probably run at about 20 degrees and then you would need to factor in the ambient temperature. 40 degrees does sound a bit high but if the ambient external temperature is 25-30 degrees then it is probably accecptable.

> and what would be dangerous?.

I'm not quite with it this morning but IIRC the temperature spec for IC's s -20 to 80 degrees C (Industrial) and -40 to 120 degrees C (Military), provided the temperature range falls within that of the Industrial spec you should be ok.

Hello Liam,

l> > Of course. But anyway: It is not an emulator. 8-)
l> I've been having this argument on CIX, too. Why not? It runs under
another
l> OS, it cannot boot natively on the hardware, ...
That's a point of definition. "What is an OS?"

To your definition (and I do know: You're really not alone with that ;-)),
PC
GEM and Windows/Win95 are no OS (needing DOS to boot and using parts of
DOS),
MagiC is no OS (although replacing TOS completly, it needs TOS to boot),
ABC
GEM is no OS (needs TOS not only to boot, but uses GEMDOS (and therefore
BIOS/
XBIOS) of native TOS), MultiTOS would not be an OS, ...

You see what I mean?

In my definition an OS is that part of system, which give the (on it
running)
applications the needed I/O functions
(floppy/printer/screen/keyboard/...),
memory management, file systems, ... (a little bit difficult for me to
express such "complex" things in a foreign language =;-))

l> and it exists so that you can
l> run software from another computer on a Mac that could not normally run
l> that software.
Yes, but it does not *emulate* anything. So at least it is an "OS
enhancement" (a software which makes it possible to run GEM programs
native
on MacOS). ;-)

l> That is almost a definition of an emulator!
So i.e. Windows is an emulator? ;-) What is an "another computer"? Another

CPU? Another hardware manufacturer? What's about the same operating
systems
on different computers (Linux, Windows NT Intel/Alpha, ...)?

No, I think the definition is somewhat like "makes software 'believe',
that
they run on a piece of hardware, which is indeed faked by the emulator".

That's why MagiC PC is an emulator (emulating ST hardware with MagiC
running
on it, i.e. also capable of booting a TOS, which then "believes" it runs
on a
ST), MagiC Mac is not (emulates nothing, especially no ST hardware and it

doesn't emulate the OS functions of TOS, because it *is* the "OS").

Greetings, Oliver

1234. Re: GEM Family tree

Newsgroup: comp.sys.atari.st
Date: 1999-10-25 00:00:00 UTC
From: Oliver_Schildmann@LU.maus.de
Message-ID: <199910250000.a7840@lu.maus.de>
Source record: 71619

Hello Liam,

l> I think the best way to publicise such machines, though, is to call
them
l> ST-compatible, as that is surely the machine most people will know
about.
Yes, that's true.

On the other hand: At least within a list referring different GEM
versions,
it is IMHO absolutly wrong. The meaning of GEM was writing hardware
independent software on multiple platforms. So the point of TT, Hades,
Milan,
MagiC Mac, ... *is* in fact *not* to have the same (or at least
compatible)
hardware (which is IMHO also implied with ST-compatible), but to have
machines which are at least capable of running *clean* written 68k-GEM-
programs! ;-)

Or, even better, just clean written GEM programs. In fact, there are some

programs which, after new compiling of course, are running on both PC and

Atari GEM. :-) At least, "piggy" written ST software does not run on TT,

Hades, Milan, MagiC Mac, ... (but does on MagiC PC - sorry, couldn't
resist
;-))

So for *us* Atari users, it is a *big* difference whether a program (or a

hardware) is ST-compatible (which means running only on ST's and *maybe*,
if
you are a lucky guy, also on newer hardware), or written as a "real GEM
program" (which means running on the appropriate OS version listed in the

"GEM Family tree" regardless which 68k hardware is beneath it). ;-)

That's because the ST series uses underneath the VDI not the GDOS (as it's
PC
counterpart), but very hardware dependent functions called Line-A. In
addition(!) and parallel(!) to VDI the Line-A functions could be called by
a
programmer directly (like BIOS/XBIOS instead of GEMDOS) for screen output
and
some other things. So a programmer had to decide (or was nailed to the
"decision" by his programming language), whether he uses (for some

programmers) more simple (and sometimes faster) Line-A calls or its VDI counterparts!

With the TT and its new resolutions, the Line-A functions were removed (at

least for non-ST-resolutions - for ST resolutions the stayed for compatibility reasons), forcing the programmers *now* to use the hardware

independent VDI library instead (which makes the software to run on every 68k
GEM, regardless which computer).

From TT030 TOS release notes: "The Line-A graphics interface is maintained

for backwards compatibility with existing ST programs only. It should not be
used for new programs. It will not keep pace with future hardware or software
improvements."

And that's why a Milan (and other ST successors) can't be titled as "ST-compatible" ...

PS: On the other side the PC carries old behaviour with it from new hardware
to new hardware, trying to make the hardware as most compatible as possible,
not as much as really needed! A new PC has indeed much old crap (A20 gate,

640 KB main RAM, shadow for video ROM, switching between FPU and MMX functions, ...), not even really necessary, but slowing down the system! Indeed, PC-compatible is something else and the silicon god may bless Atari
for it's consequence, not to define there mistakes as a "standard" ... 8->

But even today programs are announced to run on "all ST/TOS compatible computers". So it's not a difference for all Atari users and I would call an ST only program "Atari ST-only". At least it's a matter of the system requirements because even clean written Atari programs tend to require special hardware/os features.

The drive is a 720, upgradable to a 1.44 (not that cheap, though). The
RF unit, as I understand it, senses that a signal is coming and
provides the switch independently of the system providing the signal.
If correct, that means that an auto-switcher should work with any RF
signal.

Freek,

good news... I use Opera on my Winbox, fast, small, really a nice
one. If they can port it to MagiC OS, great stuff (tho' personally I'm
afraid I won't use it again on the Atari boxes). The platform however
could see a decent fast browser that also works :-) I could do with a
port to Linux as well...

A little correction:
GEM-Takes-Parameters exist also in TOS 2.06, as well as 1.44MB support-
and, of course, XCONTROL can be used with older versions of TOS.
And I think that higher resolutions are also supported in 2.06, aren't they?

I've been unable to post for a few days, but I'm glad you figured it
out. Higher resolutions were added in TOS 2, TOS 1.x only truly
understands the basic 3 resolutions (some exceptions apply, as always).

1257. Here's an idea...

Newsgroup: comp.sys.atari.st

From: nameerf@flash.net
Message-ID: <a74R3.487$49.39686@news.flash.net>
Source record: 71642

Consider this:

If you take the Web Browsers available for TOS machines (CAB, Adamas, Wensuite, Newsie, and Lynx), combined you pretty much have the browser that we've been wanting for a long time. But apart, they all fall short in one area or another.

If we could get Alexander Clauss to release CAB's source code (since he obviously isn't interested in supporting us any longer), and get the authors of most, if not all the others to work together on one large project, I think we would have something great on our hands!

Here's my idea of a great browser:
1. Take the HTML support, GUI, fonst handling, and other important features from CAB that are lacking in the other browsers.
2. Add them to the JavaScript support and graphics display from Adamas.
3. Add that to the overall speed of Wensuite (if that's possible).
4. Add that to the FTP, News, and Mail support incorporated in Newsie, Adamas, or Wensuite.

Just think, instead of a bunch of people working on different browsers that are more or less incomplete, why not work together to bring what they have into one complete browser? I think it is very selfish and overly competetive for this market when we have everyone isolating themselves creating software that really doesn't do what's needed instead of bringing individual talents together and making one heck of a great piece of software! I'd personally rather see one great browser instead of bunch of mediocre ones. Just an idea... Any other thoughts?

1258. How much is my Mega STe 4 System Worth??

Newsgroup: comp.sys.atari.st
Date: 1999-10-25 00:00:00 UTC
From: John Stanmeyer <jstanmeyer@hotmail.com>
Message-ID: <j%3R3.4459$l05.108834@typ11a.deja.bcandid.com>
Source record: 71643

Hello,

I just fired up my Mega STe4 system after not using it for nearly 3 years. It still works great, and I'm considering selling it... the question is how much is it worth?? All opinions are welcome, even if you have no interest in buying...

If you are interested, and the price is right, I will part with this system... otherwise I may keep it for periodic nostalgic relief from the hideous world of Microsoft!

John Stanmeyer
(jstanmeyer@hotmail.com)

Here's the setup (p.s., shipping/pickup in the Washington, DC area):

CPU
========
Atari Mega STe w/ detatchable keyboard (circa 1990)
16Mhz Motorola 68000, with cache
4mb RAM
Internal 45mb Hard Drive
Internal 3.5" high density (1.44MB) floppy
Enhanced graphics (4096 colors, Blitter chip)
Enhanced sound (Stereo DMA audio)
I think the OS is TOS version 2.06. I think.

OTHER HARDWARE
==============
SC1224 Color Monitor
Practical Peripherals 14.4kbps external modem
Golden Image atari-compatible mouse

PORTS:
======
Parallel Port
3 Serial Ports
VME Bus
MIDI In & Out
LAN port (appletalk?)
DMA hard disk port w/ ICD Link SCSI adaptor
Atari Monitor Port w/ adaptor for Multisync VGA (get color AND monochrome hi-res on ONE monitor!!)
RF Modulator
mouse and joystick ports
Extra floppy port

Stereo audio out RCA jacks
Atari ROM cartridge port
probably more... this thing has more ports than any modern-day computer!

SOFTWARE:
=========
Warp 9 GEM Graphics Accelerator
SPEEDO GDOS Scalable Font Engine
Pagestream 2.2se Desktop Publishing Software
Atari Works (Word Processing, Excel command-compatible spreadsheet, database)
FLASH 2.2 Telecommunications software
OPUS Lotus 123-compatible spreadsheet (PD)
Substation DOOM-like game (really awesome!)
Diamond Edge Hard Disk Utilities (partition, defragment, etc.)
Utilities to view/play common media files (GIF's, JPEG's, WAV's, AU's, MOD's, etc)
An early version of STIK TCP/IP and CAB (Crystal Atari Browser)
DOZENS of disks of desk accessories, utilities, games, multimedia demos, etc.

CLASSIC, RARE SOFTWARE WITH BOX AND MANUAL:
==
SPECTRUM 512 Paint Software (incompatible with STe's)
MICROSOFT Write (yes, Microsoft actually made a product for the Atari ST line!)
PC Ditto IBM PC-XT Emulator*
*I also have the manual and software for the "Vortex AT-Speed" IBM AT (286) hardware emulator, but seem to have lost the emulator itself (I remember uninstalling it because my machine didn't like piggybacking the Motorola 68000 on top of it).

Actualy the emulator that's embedded in Calamus SL99 pc is STemulator
which BTW works only in combination with Calamus. However if you buy the
combined TOS/pc version you can use MagiCpc instead. I'm been told Calaums
works faster if one use MagiCpc. At the latest Neuss Atari-fair I saw a
demonstration of Calamus SL 99 on a pc (I don't know which one however)
and I must say that the speed was incredible fast.

True, but I would hope that we'd be beyond the MS-Netscape ideologies.

>It's the HTML support which is lacking in CAB.

Yes, but it is at least much better supported than in any of the other
browsers available.

>Adamas has no built-in FTP, News, Mail support. There are external
>clients such as Marathon which handle e-mail. Personally I don't like
>those big browsers with built-in FTP, News and e-mail - the external

I know this would probably be a programming nightmare, but I would
like to see a browser that could do both -- offer built-in support for
those who don't want to deal with multiple programs, but allow users
to set it to recognize external programs instead, if desired. But I
just like lots of choices, so...

>The idea is certainly great ... but: all programmers have different
>coding styles so they would have at least spend a lot of time finding a
>way to work together. Money is also an issue: a browser means a lot of
>work and how do you pay six or seven programmers working on one

Good point!

>Use the browser that fits your needs. The programmers try to program
>for a fragile market and I don't think they are selfish.
>As long as you don't copy a programs look&feel competition is ok.

The problem is, no single browser fits my needs. CAB and Wensuite
don't have Javascript support (and I'd like to see nicer image display
like Adamas has), Adamas and Wensuite don't have nearly the HTML
support that CAB does, Adamas is very lacking in options and font
support, etc... So my point is that there are a bunch of browsers that
just don't cut it.

Bear in mind that Atari Computing saw limitted distribution and
that popularity contests do not reflect the number of users, but
only the number of people who bothered replying to the poll.

In reality, as far as Atari production and sales figures are
involved, the results would probably be something like:

STF,STFM
STE
MEGA
TT
Falcon
MEGA-STE

...in that order. This very much follows the number of units
produced by Atari. However, most ST users out there only use
their machine for MIDI sequencing and never even bothered with
networking it, in real life.

That is not likely to ever happen. Alexander is under a contract
with ASH. They litterally own CAB.

> (since he obviously isn't interested in supporting us any longer),

Picture yourself as a talented young German programmer who used
CAB as his graduation thesis. You need to make a living at this,
so you sign a contract with the current most happening company.

Two years later, the money still isn't there because Atari has
become a really marginal market, where everyone expect everything
to be freeware. You're on your last college year and the money
from your student tutoring isn't quite paying the bills.

Then, you notice this Mac you've been using as a colour Atari
laptop, on the corner of your tiny dorm room, to develop CAB
under MagicMac and think... Mac, why not? There is still some
money to be made there and both the GUI and the TCP stack are
standard; none of the Atari mess. Let's do it.

***

Porting Netscape sounds fun, but in practice, it's not feasable.
Ever tried Netscape on Linux 68k on a TT? Slow as hell... Now,
just try to imagine on Magic or N.AES... patheticaly useless.

Looks like the sinclap random string generator is back.
Someone must have forgotten to update the sinclap internal
data reference libraries, though. G3 266 PowerBook? That's
old technology, G3 PowerBooks are at 400MHz now.

By the way, has anyone successfully run sinclap on a CT2?
I can't get it to run with the fast RAM flags switched on.
Is it allocating critical buffer space in the ST RAM address
range?

I'd love to see how much quicker sinclap can spew garbage
at the higher clock speed (does anyone have a Mac executable?
What spew-rate does it achieve on the new G4 processors?
I'm sure that's a much better performance metric than the
weedy signal processing libraries they took from Intel's
web site to prove its performance over the PIII)

And they already skipped us; permanently. I've had several email discussion with them. Their experience of marginal platforms is that the market is already gone, even on Amiga, so nothing gets done by the team of volunteers from each platform.

To which I might add:

It is currently the most overpriced and worst supported piece of
hardware outside California. Forget about finding anything Apple
at a price that comes even close to the US list price; European
prices are over inflated twice and Apple isn't helping.

So much for the oh-so-great iMac. Heil Jobs-less!

Nothing can be done due to the heavily encrypted security
algorithms in the sinclap random string generator. It will
post drivel anywhere and everywhere, you can't stop it or
protect yourself against it (yet). Let's just hope it suffers
Y2K syndrome and kicks the bucket come 2000.

At the moment, I have a top team of experts working around
the clock to develop a sinclap suppressor, which will only
work on Atari systems. With a 8MHz 68000, we can already
achieve overall 23% attenuation of the output spectrum, but
somewhere along the line we're getting a bus error on the
ST development system. Probably accessing an odd address at
some point. I'll re-compile it for the 68030 and see if the
same happens. We plan to open a web site soon, with all the
latest patches for you to download.

well first I'd like to apologize to Johan. I'd completely forgotten that
the 'f' also stood for free and fast! :-) and I realized I'd mistakenly
tied fVDI to Titans card, fVDI was in development before Titan(now Core Tech)
started talking about TempeST or Eclipse. Core does promote fVDI though! :-)

> You are suggesting this as a new entry? It's not just an add-on to NVDI?

Well Johan has better info than me of course! :-)
No, fVDI is not an ADD on to nVDI.
both are new VDI's but nVDI will also handle fonts, so you could use it with fVDI
(to handle the VDI) while nVDI, or FSM-GDOS, or SpeedoGDOS, some other GDOS
could be used for the fonts. Right now for example I can load nVDI for its
VDI capabilities, and then load SpeedoGDOS right after it. SpeedoGDOS will be
my font GDOS, nVDI will be my VDI accelerator!

an AV-server facilitates passing messages between, and starting up, applications.
i.e. drag'n'drop. OLGA is a client I believe, programs like Finder by Holger Weets
make us of the AV-server. eg. double clicking on a found file will start it, or
the associated program.
Someone else should probably talk more about this, as I don't know enough about this
NeoDesk has some AV-server capabilities, but apparently Thing is the best so far
(Jinnee also?)

68000, it's the Dragonball-based Pilot. When sinclap uses his Palm IIIx,
he's using "yester-decade technology".

I noticed that Opera was developing a version for FreeBSD(Linux) and X11.
Since MiNT has its beginnings AFAIK in NetBSD, I suggested to them that
they keep half an eye open, when developing the FreeBSD version, on NetBSD
and ultimately a MiNT version, as it _should?_ not be very difficult to
continue porting to MiNT if progress has already been made to FreeBSD/NetBSD.

I heard nothing back from them, but that doesn't mean they aren't keeping
an eye on it

On ftp.cs.tu-berlin.de there is Teradesk 1.40A in English and French.

Basic qualities of this desktop are small size and decent speed- which
made it convenient for multitasking environment when there are memory
and speed restarints (for example geneva+teradesk); but there are no
fancy options in it, its functionality is approximately similar
to that of TOS 2.06 desktop.

I would even be tempted to use it, but teradesk just lacks a couple
of integrated functions that I want: a) file search, b) floppy formatting,
c) keyboard shortcut configuring.

Cu.

Matthias,

not completely: at least on WIN I do have a fast browser. Fairly
compact too: Opera. For Linux I still use Netscape, and the first
opportunity to shove that one into the can I'll take with both hands.

Atari: just dunno. CAB? Not any longer. Wensuite? At v. 3.somuch it
behaves like it were v. 0.000009alpha..... Unless you run a Mac with
MagicMac.
Draconis? My experience on a TT not much better.
OK, there's probably the h/w limits, but then again, who's gonna
switch to a Milan-060 or Phenix of 'm all soon? Next Q: do Wensuite
and Draconis work nice on these systems?

Nope, I'm gonna say it again: I don't regret the switch...

>page TIFFs.

OK I have tried the netpbm software that Mario kindly made available
and it does read the TIFF files. The headerdump option proves that
it know exactly what the file is and how many pages there are too.

Unfortunately I have only been able to make it output the 1st page
of a multi-page TIFF.

I cannot claim to know what I am doing and it took me a while to get
the relevant binary to do anything. When I did get it working I
managed to output a PBM file that GemView will read. The tifftopbm
binary doesn't by default output any more than one page and there
doesn't seem to be an option to change that. I may be completely
wrong so if anyone knows differently I would be grateful if you
could let us all know.

Rich.

Hello again,

I've been trying to track down two items for my MegaSTe:

1. An accelerator card that will bring my Mega up to 30MHz or more.

2. A VME graphics card (eg. Nova, Crazy Dots).

Does anyone know where I can find things like this?

Thanks,
Laurence

The PC1426 can display ST Low, ST Med, ST Hi, TT Low & TT Med,
but not TT Hi. Choose TT MEd as your regular screen (device 6 in
the Newdesk or MagX Inf file, though some progs seem to think this is
ST Low!

Cheers,
Charles.

You won't get the Postscript support in that case BTW.

>I think I want both, then! ;!)
From what I understand NVDI switches the Blitter off tho'.

In the future should you decide to upgrade your ST with an accelerator etc you might find terrible incompatibility problems with a Blitter BTW.

It was written in assembler AFAIK, hence it's very fast but has problems
with some Falcons which have iffy hardware. Apologies if I've muddied the
waters a few messages ago by suggesting the relationship between MagiC and
Kaos. Same author, and the command shell is the same or an update (at least
the docs imply it - note TOS doesn't have a command shell built in so it
would be an extra). I wasn't aware that Kaos was a TOS patch, though,
thought it was a separate entity hence my guess that one may have developed
from the other. Oops.

Probably a problem with the demo; many speak very highly of it in practice.

> The PC version runs, though, and looks quite neat. Shame it is all auf
> Deutsch and can't access PC drives, though.

Demo restriction: v1.2 (equivalent to Atari MagiC 5, MagiCMac 2) is
available in English. Not sure if 6.1 is out yet - they've harmonised the
version numbers across hardware platforms now, BTW hence the leap in
numbering. Also 1.2 happily uses PC drives (you map drive letters to drives
or folders as you wish).

> (Jinnee also?)

dives in

I'm not an expert on the ins and outs, but AV-protocol and OLGA are separate things (though possibly OLGA needs AV-protocol??????).

AV-protocol allows programs to communicate via the AV server, most common example is when a program like CAB calls an external viewer. If the viewer understand VA-start messages, CAB uses AV-protocol to launch it via the server. Practical effect of this is that if the viewer is already running it just loads the new file (rather than starting another instance of itself as with a normal command-line with arguments), or if it isn't running the server starts it and it loads the file in the usual way. Similarly, double-clicking a Papyrus file from the desktop will just load it into Papyrus if it's already running.

AV = Adonis/Venus AFAIK, Venus being the desktop half of Gemini, Adonis being Mupfel (the shell), though why Mupfel should be known as Mupfel rather than Adonis beats me. Doubtless lost in the history of Gemini development.

OLGA stands for Object Linking for Gem Applications and is the Gem equivalent of OLE in Windows. The OLGA server runs in the background and allows OLGA-aware apps to communicate. One simple example is the CAB/Everest combination for HTML authoring; every time you save the file in Everest it tells CAB to reload it so it updates in CAB automatically. Later developments include in-place drawing, eg an Artworx graph embedded in a Texel spreadsheet with real-time updating. There is also a program called Olganisator or something similar which is supposed to be able to fake this sort of behaviour for non-OLGA-aware apps though I never managed to get it to work.

That's great. Thanks!

I now have Teradesk running under Gemulator, but it's all in German (or
possibly Dutch.) I am told there's an English version - where?

Very good point.

The only problem I see is that with systems like MagiC, GEM is not the only target any more.

I don't know how MagiC was developed. However, there are implications and hints that it started with KaosTos, which was essentially a cleaned-up and debugged version of TOS. Is MagiC really a totally clean system, redeveloped entirely from scratch, or is it based on Atari code?

If it's all new, then what does GEM-compatible mean, if you might be running on MiNT, replacement AES and VDI modules and a third-party desktop? GEM compatible, when there is no GEM there at all?

Most modern PC software would not and can not run on an actual PC. Even so, that is what it's called: /PC/ software.

It may not be accurate but it is easy to understand!

> Or, even better, just clean written GEM programs. In fact, there are
> some programs which, after new compiling of course, are running on both

I see. Fascinating. This is the first I have heard of this, although I suspected that something like it must be the case.

> not to define there mistakes as a "standard" ...

Sad but true!

It's such a pity that such a bad machine design won the platform war!

Call it ST/TOS compatible - "compatible" doesn't neccessarily mean that
it is 100% compatible.

AFAIK neither MagiC nor Kaos are based on Atari TOS. Atari haven't
licensed their code to ASH/Andreas Kromke and therefore it would have
been illegal to use copyrighted code.

>
> If it's all new, then what does GEM-compatible mean, if you might be
> running on MiNT, replacement AES and VDI modules and a third-party
> desktop? GEM compatible, when there is no GEM there at all?

It's TOS compatible - it runs most of the applications designed for the
operating system TOS. Not many use the term "GEM compatible" however.
BTW, an original GEM (such as in Atari's TOS/MultiTOS) shouldn't be
called GEM compatible because it is /the/ GEM.

>
> Most modern PC software would not and can not run on an actual PC.
Even
> so, that is what it's called: /PC/ software.

> It may not be accurate but it is easy to understand!

Just use the term that's easier to understand - it really doesn't
matter. Every Atari user has another viewpoint in how to call
ST/TOS/GEM programs.

>

The most problem with Line-A is that some Atari compilers still use
Line-A and so the generated programs use Line-A,too (but there are
patches available).

I don't want to disappoint you but I guess ASH won't allow the release
of CAB's source code. *Maybe* Alexander would give it to another
programmer.

>
> Here's my idea of a great browser:
> 1. Take the HTML support, GUI, fonst handling, and other
> important features from CAB that are lacking in the other

It's the HTML support which is lacking in CAB.

> 2. Add them to the JavaScript support and graphics display
> from Adamas.
> 3. Add that to the overall speed of Wensuite (if that's
> possible).

Wensuite would be slower if it would offer the same HTML/JavaScript
support as Adamas.

> 4. Add that to the FTP, News, and Mail support incorporated in
> Newsie, Adamas, or Wensuite.

Adamas has no built-in FTP, News, Mail support. There are external
clients such as Marathon which handle e-mail. Personally I don't like
those big browsers with built-in FTP, News and e-mail - the external
clients are in most cases much better and easier to use.

>
> Just think, instead of a bunch of people working on different
browsers

> that are more or less incomplete, why not work together to bring what
> they have into one complete browser?

The idea is certainly great ... but: all programmers have different
coding styles so they would have at least spend a lot of time finding a
way to work together. Money is also an issue: a browser means a lot of
work and how do you pay six or seven programmers working on one
program? That web browser would be expensive!

>I think it is very selfish and
> overly competetive for this market when we have everyone isolating

browser
> instead of bunch of mediocre ones. Just an idea... Any other thoughts?

Use the browser that fits your needs. The programmers try to program
for a fragile market and I don't think they are selfish.
As long as you don't copy a programs look&feel competition is ok.

IIRC There were 2 Atari companies; Atari (corp) that dealt with our
humble machines, and Atari (Games) that produced the games for coin-ops!

Did/has Hasbro bought both companies?

The name Atari appears on 3 new games for the PlayStation, Centipede,
the new/next Tetris you mention and another one that I've completely
forgetten...

Is the "Atari" logo a good selling point? Funny considering Sega daren't
even put their logo on the Dreamcast... :)

This works for me: stick WINSIZER.PRG (which is contained in the Gemulator 98 archive) into the AUTO folder. When the "ST" boots, a menu comes up asking you to select a screen size (Normal, 640x480, 800x600 and so on)

I can have up to 1024x768 mono on this 17inch monitor, and it still runs faster than my normal ST, which is quite remarkable...

Anyone know if Magic 2.01 supports larger screen sizes - I would have thought it would do, but so far it won't work...

John,

it still won't solve the troubles you get when you're looking for an
Unzoo-er and get a ZOOTTP.ZOO file... :-)

Maybe I should create a new real fast archiver/unarchiver with a new
standard-to-become format, something like SAU (Simple Archiver
Utility), having all the goodies and not the baddies, complete with a
new file format, .SAU... I'll make it available in a SAU format
file...

Hello mjaap,

m> But even today programs are announced to run on "all ST/TOS compatible
m> computers". So it's not a difference for all Atari users and I would
Yes, *TOS* compatible. The Milan is not ST, but TOS-compatible.

m> call an ST only program "Atari ST-only". At least it's a matter of the
m> system requirements because even clean written Atari programs tend to
m> require special hardware/os features.
The problem is, most times this belongs to old software. At that time
nobody
stated his software as "Atari ST-only", because the ST *was* the *only*
Atari. ;-)

New software is (mainly) supposed to run on every TOS hardware.

Included with Gemulator are two programs which do this - Vgawin and Winsizer.
Both give you the option to select a screen size. If I recall they might
be included with the free Gemulator 5 download...

Kaos is definitely based on TOS (1.04 IIRC) - that's why it was only
distributed in form of a patch against an original TOS, which you
needed to own already.

Magic is a complete re-write from scratch AFAIK.

If any one wants the ZOO package, ZOO21.LZH
give the usual yell and I will post. Be warned that ZOO.TTP is pure
command driven, if you drag a ZOO file onto it it gives you the list of
commands. I cannot find a shell, but it does work, some of the
GhostScript package was ZOO'd and it decompressed OK. It has the useful
property of not breaking down if it detects a bad file, but giving you
local address, with the option of decompressing only the good files.

Bob King.

Ah, I didn't know that. However, it is very obviously a patch. There are
even copyright notices still in place.

> Magic is a complete re-write from scratch AFAIK.

That's what I would like to know more about. It is almost suspiciously
similar and cloning an entire OS is not easy.

I must point out that I am not accusing ASH of any illegality.

I'm just curious...

Redownloaded MagicMac. It locks my Mac solid - not even mouse movement
works. Same when booting without extensions.

I'm not impressed.

The PC version runs, though, and looks quite neat. Shame it is all auf
Deutsch and can't access PC drives, though.

> said already, "a port for what? TOS, MagiC or Mint?"

But she commented on a port of an Unix program - which should make a
difference. If you write a browser from scratch you certainly won't
have to ask the OS question since you would write it as a clean GEM
application.

> Knowing what happened in the past, I come to think they might just

I believe there were not enough programmers/request for an Atari
version of Opera. It even took ages for them to find reliable Mac
programmers.

Hi!

In article <memo.19991026012236.105D@lproven.compulink.co.uk>,
lproven@hotmail.com (Liam G. H. Proven) writes:
> But imagine a system where ALL software can track threading perfectly.

Well, I bet "ALL" is still a very small number compared to the number of programs you get for UseNet. And it's also not the fault of UseNet that there's broken/incomplete software out there.

> Where you can ALWAYS get the previous message, even if it was 10 years
> ago.

Well, just think how many disk space you (or the news server) would require to store all UseNet-message of the past ten years, even with all binary postings removed.

For yourself, if you use an offline newsreader, it's no problem to never delete old messages, or only kill them selectively, so you'll be able to return to old messages as well.

If you want more, use services like Deja News. Very nice to consult when you have a specific problem.

> Where crossposting and pictures and spam are not allowed.

Crossposing is a fine thing, when used correctly (i.e. with a Followup-To:-Line in the header). Unfortunately, a lot of people don't know how to or don't care.

As for SPAM, well. The UseNet has no central controlling instance (which has pros and cons, of course), so nothing is actually "forbidden". There's the Netiquette, which has been enough for years, though a lot of new users tend to ignore it, as "rules are only there to be broken" :(

There are special newsgroups for pictures and other binaries (namely the alt.binaries.* hierarchy), though there are newbies and idiots who still ignore that.

Anyway, what happens if you try to post a picture, maybe split into 100 small parts, to "your" net?

> Where a newsgroup can be subdivided as many times as you like, and
> remain as a single entity.

Sorry, what's that supposed to mean?

> It's better. Really.

Maybe, but my original intention was to point out that UseNet does not have "poor threading", but there's poor software that "hides" threading information.

Ciao

Thomas

Hi

There is a program that allows use of a Degas picture as the backdrop of
the Desktop, but only in Low res.

Third party replacement desktops allow a change of backdrop, but never
using one I can't comment on them.

1329. MagiC Online Update

Newsgroup: comp.sys.atari.st
Date: 1999-10-27 00:00:00 UTC
From: Bengy <bengy@atari.org>
Message-ID: <7v5knm$78$1@nnrp1.deja.com>
Source record: 71477

Hi All,
Just a quick note to let everyone know important information about certain issues:
I moved to a different city and currently don't have a computer, Im saving up from each paycheque though, so MagiC online will reopen at that time, it shouldnt be too long, perhaps 1month-1 1/2 more months.

The main thing I wanted to clear up was about the MagiC Game Contest, it is ofcourse still running, but I must say only because of Jan Daldrup.. wow, I cant thank him enough for the work he's put into the project, and the nicest thing about it is that I didnt even have to ask him, he just voluntarely took over where I left off! One thing that concerned me was I saw a message saying that someone made a game for the MGC but had already released it.. Remember all, if you do make a game for the MGC, it Cant be released until the official release date.. these rules are on the MGC homepage.

Anyways, Im typing this at the public library which is "strictly for research" so the librarians are giving me evil looks :) Ill be back online in no time, and ill make an announcement then.

Take Care,
Bengy

About Email, Unfortantly My Email account choked (it only has a limit of 200 emails, and at app. 100 emails a week it didnt last long.) So if you sent me something and it bounced back, thats why! :)

MagiC Online : Not dead, just sleeping.

1331. Re: GEM Family tree

Newsgroup: comp.sys.atari.st
Date: 1999-10-27 00:00:00 UTC
From: Oliver_Schildmann@LU.maus.de
Message-ID: <199910270000.a10094@lu.maus.de>
Source record: 71479

Hello Liam,

l> The only problem I see is that with systems like MagiC, GEM is not the
l> only target any more.
At least, MagiC is GEM-compatible (with some traps). MagiC offered possibilities ("full" multitasking of GEM programs) which were much ahead at
that time. GEM offers even in its "base" multitasking and MagiC tried to follow that path to more usage. At least, when Atari came to multitasking,

they did it a little bit different, so MagiC is not fully compatible to Atari-
GEM. At least, Atari-GEM is also not fully compatible even to PC-GEM. But

nothing a normal programmer can't cope with ...

l> I don't know how MagiC was developed. However, there are implications and
l> hints that it started with KaosTos, which was essentially a cleaned-up and
l> debugged version of TOS.
A *very* cleaned-up and debugged version, including complete reprogramming of
many functions and adding some functions and behavior known from PC GEM/1 and
GEM/2! :-)

BTW: At the KAOS based on TOS 1.04, Andreas Kromke removed the "Rainbow",

because he needed the place for some own code. :)

l> Is MagiC really a totally clean system,
l> redeveloped entirely from scratch, or is it based on Atari code?
Redeveloped entirely. It's kernel is written with a (for that duty made and
grown) macroassembler, with C around it. No Atari/DRI code whatsoever.

l> If it's all new, then what does GEM-compatible mean, if you might be
l> running on MiNT, replacement AES and VDI modules and a third-party
l> desktop? GEM compatible, when there is no GEM there at all?
GEM, at least, is GEMDOS, AES and VDI - nothing more, nothing less.

So if you have an OS which have functions with calls and parameters compatible to GEMDOS, GEM-AES and GEM-VDI, it should be "GEM-compatible",

because it behaves like that. ;-)

In addition, if that OS has on the lower (hardware) level a part which is

compatible to BIOS and XBIOS, it would be "TOS-compatible".

l> Most modern PC software would not and can not run on an actual PC. Even
?

l> so, that is what it's called: /PC/ software.
l>
l> It may not be accurate but it is easy to understand!
I am German, I can't follow! =:-)

l> > some programs which, after new compiling of course, are running on
both
l> > PC and Atari GEM. :-)
l> :¬) So far, I know of 2! A maze game and Tetris. I believe someone is
l> working on Chess.
Well, I didn't know that. I thought about applications (first of all,
there
comes a nice text editor in my mind - but there are so damn good Atari
text
editors, I don't have this one in my sorted archive to tell you easily
:-/).

l> It's such a pity that such a bad machine design won the platform war!
Hehe, in the actual SPIEGEL (a German magazine similar to Time), Scott
McNealy (CEO of Sun) again and once more stated, in his very own (and
known)
way, his strong opinion about the alliance Microsoft/Intel.

Nicest sentence (about the ease of use): "The only computer which can't be

understood by everyone is the Microsoft PC."

Well, he obviously didn't thought on Amigas ... ;-> (OK, OK, the AmigaOS
went
better by time ... =;-)

l> similar and cloning an entire OS is not easy.
"Easy" if all functions (and its behaviour) are documented, difficult if
there is a need of "Secrets of ..." books. ;->

l> I'm just curious...
There were/are very talented programmers on the Atari systems.

Otherwise, to develop (more than) a GEMDOS replacement like MiNT, would
make
me curious too! ;-)

l> The PC version runs, though, and looks quite neat. Shame it is all auf
l> Deutsch and can't access PC drives, though.
One of the demos awfull limitations (+ limited RAM size, resolutions,
speed,
time and maybe more). :-/

You have to create drive containers. Then you can copy files via floppy to

the container.

Maybe I'm missing something here but I'm sure a LZH file extension indicate a Lharc compressed file in which case the person your sending it to will need to have Lharc in order to extract and use the files.

Personally I think things would be easier if everyone standardized on Zip files and used something like ST ZIP, for a start you can set up any files your sending someone as a self extracting file thus preventing the need for them to have a copy of ST ZIP before they can unpack and use the Zipped files, secondly it is compatable with WinZIP and so the flies can be accessed by both Atari and PC users, I also find ST ZIP's Gem interface much easier to use than Lharc's command interface.

Stephen

For God's sake don't be such a nit-picker, I'll re do the ZOO package as
a ZIP file if that pleases you. ZOO.ZIP or whatever I choose to call it,
will be available for any one who want's it.

You cann't please some people, can you!!!

And as for your remark about the LHZ interface, yes the core is a TTP
program, but there is a SHELL, two of them in fact, which looks much
like STZIP. Oh yes I even provide a self unzipping version, just to keep
you happy.

I'm only trying to help!!!!!

Bob King.

hi,

I'm a brand new user of an atari mega ste and the version of cubase
3.01.

I want to transfer (dump) the midi data between my sequenceur QY70 and
cubase and between cubse and the qy70.
I use some shareware but my atari say whan I load the program "error tos
#35"

Someone could help me.

Hi
My interest in this is to support linux68k on my TT, are any of the chips
supported
in the Xfree source distribution?
One of my TT's is running the Linux 0.99pl13 version but I would like to
upgrade the
software and hardware.
So please put me on your list for when its ready.

regards

Maybe some small external programs (aka plugins) which hide their
menubar etc. would be the best solution. I don't know how far the
plugin architecture of Adamas goes since I am not a C programmer.

>
> >Use the browser that fits your needs. The programmers try to program

that
> just don't cut it.

I can only say that Jens (Heitmann who programmed Adamas) puts a lot of
working into Adamas. Of course being a single programmer working on
such a project means that it currently can't compete with Netscape.

Did you tell Jens Heitmann what you like/not like?

>
> Thanks!

I have an old SUPRA drive. I't been hacked some, as it used to be a 20Meg, and I'm not sure what it is now. probably 30 or more. Since I seldom use my ATARI equipment anymore, I'm not sure, but if you're interested let me know and I'll check into it. It has the built in ATARI to SCSI adapter mounted inside, so it's plug and play. If you'r interested, email me directly.

Personaly I don't like this idea because ZIP can cause lots of trouble and
above all it can't handle long file names very well.
A better choice is LHARC.

>files, secondly it is compatable with WinZIP and so the flies can be
>accessed by both Atari and PC users, I also find ST ZIP's Gem interface much

The LHARC GEM shell is much better then STZIP but unfortunately it doesn't
support the latest LHARC.TTP. AFAIK Windhoos and Mac users can extract
LHARC too.

At the moment I have over 100 original and boxed games for
the Atari ST. As they are occupying too much space at my home
I desperately want to sell them quickly for ridiculously cheap prices.

I'm located in the UK, but willing to send games to anywhere in the
world.

* I have compiled a complete list with prices, so if interested send
me an email and I'll send you the list.

* I also have an ATARI STe with 4Mb RAM, all boxed with manuals,
leads, software and 4 games that came with it when bought. If
interested make me an offer. (UK pounds or US dollars only)

E-mail : oscar@agra.globalnet.co.uk

(smile)

I've tried to send a post to answer
questions about this but it doesn't seem to make
it to the list.

Basically, if you want to start an IRC
discussion, just name the time and channel and
I'll be happy to join. We need many activities
as an Atari community.
The webbased is a good for multiple
reasons, and if you are having trouble with the
self-renewing screen, try the other screen that
doesn't do that. It works great on my TT for
hours!

Advertise? I advertise to let people know
what's going on. The best way to have a
successful anything is if you let people know and
get the word out.

Anyway, if you haven't tried the non-frame
(and non-renewing) chat version on the web site,
give it a try, and let me know when you start
that IRC chat session.

> fact contradicts Peter's (xlator@cix...) opinion.

Which I happen to share.

Apparently, as you discovered, some (early?) SyQuest drives are different.
When I have time I'll try to use a SCSI utility to find out if consecutive tracks are on the same side of the disk (the SCSI
diagnostic command translates LBA to physical and vice versa).

> formatting is (a special kind of) writing!
Some (most?) drives at that time did not support LLF so they actually did not write to the surface.

Peter Schneider <Peter_Schneider@su2.maus.de> wrote in message
news:199910231618.a11715@su2.maus.de...
Hallo Folkert,

FR>What *IS* strange is that friend1 could read half of his cartridge or
FR>did he?
yes, he could! He could use the drive as a 22 meg drive. And IMHO that
fact contradicts Peter's (xlator@cix...) opinion.

FR>Was this useable data?
Yes, it was!

FR>Or did he have to reformat to regain use of the intact half.
He could do so.

FR>What is so astonishing about that?
For me, as an experienced user without too much hardware knowledge,
formatting is (a special kind of) writing!

1369. Last reminder - UK Adventurers' Convention - this weekend

Newsgroup: comp.sys.atari.st
Date: 1999-10-27 00:00:00 UTC
From: karen <karvic@btinternet.com>
Message-ID: <7v8qkb$6f4$2@plutonium.btinternet.com>
Source record: 71517

The Tenth Anniversary Adventurer`s Convention

The Royal Angus Thistle Hotel, Birmingham, Saturday, 30th October, 1999, 9am to 6pm.

Well - who'd have thought that we'd still be going strong after 10 years!

As usual the convention will run from 9am on the Saturday until 6pm and will still cover all formats.
Tables will be available if you wish to bring your own computer, and we actively encourage this, so the
more the merrier! You are welcome to bring along software/hardware for sale too, although no pirated
software please.

Adventurers come from all over the country, including Northern Ireland, and the atmosphere is very
friendly and informal. Many of us stay overnight at the hotel and the Friday and Saturday evenings are
just as lively and entertaining as the Convention itself. We still haven't managed to attract anyone from
outside the UK but we are still living in hope!

During the day we have the popular Megapoints competition running in which contestants get 20
minutes playing time at a specially written text adventure, with the object of scoring as many points as
possible in the allotted time. There are usually cash prizes and certificates for the 3 highest scorers.
(Well everyone says we should be certified!) The game this year is being written by Edwina Brown, and
the only information we have is that it will celebrate our 10th Anniversary.

Tickets are available now, and in honour of our anniversary, the price has been lowered to £5 per
person.

The Royal Angus Thistle Hotel has again given us special room rates for those attending. These include
full English breakfast and are:- Single Room £40 per person per night, and Double Room or Twin £35
per person per night. Please contact the Hotel direct to book your rooms - the address is The Royal
Angus Thistle Hotel, St Chad's, Queensway, Birmingham B4 6HY, telephone 0121 236 4211 and we
would suggest that you book early. Make sure you tell the Hotel that you

are attending the Adventurers
Convention otherwise the room prices are about double the above!

If you have any queries about the convention, or would like to reserve tables for hardware or software
please contact either Larry Horsfield or Karen Tyers:

email: Larry - alaric@larryhorsfield.demon.co.uk

Karen - karvic@btinternet.com

Do come and join us, even if only for the Saturday. If you've never been before, you'll have a great time,
and maybe you'll at last be able to put faces to those names you've only heard about, and you'll certainly
go home with a lot of new friends. If you have been before, but perhaps only to the earlier conventions,
you'll be able to renew old friendships. We'll look forward to seeing you there.

1371. Re: Latest version of my GEM history

Newsgroup: comp.sys.atari.st
Date: 1999-10-27 00:00:00 UTC
From: Detlef_Lewin@mausd.gun.de
Message-ID: <199910272346.a37679@d.maus.de>
Source record: 71519

JW>AV = Adonis/Venus AFAIK, Venus being the desktop half of Gemini,
JW>Adonis being Mupfel (the shell), though why Mupfel should be known as
JW>Mupfel rather than Adonis beats me.
A stands for application and *V* stands for Venus.

And in the Gemini-docs it says:

Ein Wort zur Namensgebung: MUPFEL kommt von Ping, dem Pinguin aus "Urmel
aus dem Eis", der immer Wawa's Schlafmuschel (seine "Shell") benutzt und
sagt "Ich will auch eine Mupfel!". VENUS lag dann nahe, in Anlehnung an das
berï¿½hmte Bild von Boticelli, auf dem die schaumgeborene Venus in einer
Muschel an den Meeresstrand kommt. GEMINI (die Zwillinge) ist die
Kombination aus beiden.

Roughly translated:

MUPFEL derives form a german puppetseries in which Ping the penguin has a
speechdefect and instead of "Muschel" (the german word for shell) he always
says "Mupfel". VENUS comes from the famous Boticelli painting showing Venus
rising up from a shell. GEMINI (the twins) is the combination of both.

So, there is definitely no Adonis involved. ;-)

Hi,
Could anyone help me as I wanting to network my sytems -

Main- STe veloce, serial upgrade 56k, modem connected.
2nd - Falcon (has most of same software as above)
3rd - STfm 1mb, floppy based (in cellar)

I`am wanting to be able to use the STfm in the cellar but be able
to access the HD on the other 2 in the bedroom, if possible.
Also whating the falcon to be able to use the modem on the STe if
possible.
What way is best MIDI to Midi, Serial to Falcon Lan or ????
What software and where can I get it.
Thank for any help.

Karl

I may be able to have them made. Ram is a pretty simple matter. I was saddened to see there were pals/gals involved in TT fast ram though. That will be a deal breaker for me. I wonder if there's a way to somehow read the logic from a pal so that it may be duplicated? Why would you even need a pal? Everything should have been designed into the MMU.

Oh, yes, I realise that. And, to be honest, the ST's blitter was never a
brilliant piece of hardware at the best of times.

However, it was a popular extra, AFAIK, and standard in the STe, IIRC. If
another popular piece of software not only doesn't support it but has
problems if one's fitted, that's bad!

Source record: 71405

Hi All,

Seeing that Draconis is to be the default browser supplied with new Milans and that it also supports Javascript I thought I would have another look.

I downloaded it a couple of weeks ago and have tried to get it to dial-in to Zetnet (my isp). Is the Milan version (demo) disabled in some way as it reports that it cannot find my modem. I've checked it is there ;-)

Using it offline to look at a few html pages I noticed that the display is a bit odd and doesn't seem to support fonts properly.

What are other peoples experiences?

Peter

Now there's a pity...

Ta for the explanation/translation: my sources (read: memory of something I
read years ago) were obviously wrong on this one. Though the above
explanation just goes to show how weird these things can get!

Is this puppet-penguin-with-a-speech-defect called Ping the same as Pingu,
BTW? Or are we swamped with puppet-penguins-with-speech-defects, in which
case the hallucinogens must be spreading in great washes across the globe
:-))

NVDI does not have problems if a blitter is fitted. It just doesn't use
the blitter, since there would be no benefit in doing so.

For faster service, Please direct all replies through E-Mail to Ben at: atari@benjamin.net or bensmith@teleport.com instead of NewsGroups as I find it hard to keep up with NewsGroups.

Atarians Unite! Are you pining for the days of a simpler Computer? Do you miss Arcade Classics like Asteroids, BattleZone, Joust, Missile Command, Robotron 2084 and my favourite Star Raiders! Well Bravo Sierra Computers has them. Are you wandering, wandering in the desert of violent video games. Games too violent for children? With Blood & gore? Two companions of youth nowadays. Especially those you hear about in the news who kill fellow students at school. If your preferences for games lean more towards family friendly. Like it used to be. Try some of my Atari Arcade classics. I have oodles of Atari SoftWare! As well as truckloads of Atari HardWare. And Libraries of Atari Books. Reference material and things you thought you'd never find! So come check it out. The best of Classic Atari 8 Bit & Atari ST. E-Mail me at

e-mail: atari@benjamin.net

Or call me anytime at (503)256-9974 to talk to a warm, friendly, people person! Your more likely to reach me from 3 PM-3 AM Pacific Standard time. And thats most likely the times I can return calls. I'm perfectly willing to call you, on my own dime to answer your questions. I'm a people person and those who have dealt with me will find me patient, a good listener and even a good teacher. So if you can't call me Today? Call me Tomorrow!

Click for WebSite!

I've added more and will be adding more Hardware, Software, Books and Accessories for Classic 8 Bit and Atari ST. So checkout what's new on my WebSite. In Fact check it regularly as my Catalogs are updated regularly. I have 6 different Catalogs, and my SoftWare Catalogs are my largest. They have the biggest Byte Count. And remember if you can't come see me today, come see me tomorrow!

also, if you live in Portland, Oregon, interested in Atari and want to meet with other Atarians. Read the Ad near the bottom of this message.

FREE Catalogs for Classic Atari 8 Bit & Atari ST Computers! Hard-Ware, SoftWare, Books & Accessories! View Atari Catalogs on the Web at http://www.atari.benjamin.net And Jump to my FTP site linked to my Web Site so you can Download Free Catalogs or FTP directly to my site at: ftp.teleport.com/vendors/bensmith/ If you can't get Catalogs that way,

Feel free to Request catalogs through E-Mail. Really, it's not an inconvenience. I do ask that you specify Atari 8 Bit, Atari ST or Both! Then I'll send them to you by E-Mail Only. Not Snail (Postal) Mail. Please let me know if I can attach text files to your E-Mail. Catalogs are just regular ASCII text files so you can download them into your text editor and view them, edit them or print them out! It would make things easier for me if you take my Catalogs, load them into your text editor, delete what you don't want and E-Mail me the rest! To expedite things, include your complete Mailing address so I can figure your Shipping/Postage & Handling. I'll be back after the weekend.

If you have an Atari and live in Portland, Oregon. U.S.A. or vicinity, you are cordially invited to attend a Meeting of the Portland Atari Club. You don't have to be a member to attend. We meet the 2nd Tuesday of each Month. Our Next meeting will be Tuesday, November 9th, 7 pm at the Pizza Baron at 2604 S.E 122nd Avenue in Portland, Oregon. Get together with other Atarians. Make friends, meet new people, maybe find an old friend. Eat Pizza, drink Pop & Beer in a decorative atmosphere. Bring your family to a family friendly place. For more info try:

http://pac.pdxweb.net

e-mail: atari@benjamin.net

For more information or directions, please call our Vice President Ben Smith at (503)256-9974 See you there!

Please Direct all Replies Through E-Mail to: atari@benjamin.net or bensmith@teleport.com. If you can't reach me at benjamin.net see my E-Mail/Web info in my Signature at the Bottom!

On ft.cs.tu-berlin.de in pub/atari/Utils/Shell/tera140a.lzh

And it might be convenient to go a couple of levels up and download
the /pub/atari/00INDEX.ALL for contents of Atari section on this site.

Teradesk is also on ftp.nic.funet.fi in pub/atari/sysutil/tdsk140a.lzh

Cu.

Agreed- not as handy; I happen to like the single-key shortcuts of TOS desktop
and I set, for example the "*" to be "Select all" and "?" to be "Show info".
I found that Teradesk's .RSC can be edited to change the keyboard shortcuts,
but only to some other [Ctrl][key] or [Alt][key] combination; single-letter
shortcuts are simply not recognized.

It's a pity it is not supported anymore; looks like Teradesk needed just
some finishing touches to become a quite nice, fast desktop for small
multitasking systems (with 4MB RAM on a Mega, if I put Mint and,
for example, N.AES and Thing or jinnee, there would be almost no
memory left for practical work).

Hi

The software I use for converting to other formats are Picswitch and
Imagecopy. Don't forget that you can always use a pc program such as
Paint Shop to convert to other formats not supported yet!

Jos> Which electronic wizzard can make this for so many desperate TTusers ??

Do you really need ST-RAM?

TT-RAM cards like the MagnumTT are readily available - simply plug in
PS/2 style SISMMs and get up to 128MB of TT-RAM, which is a lot faster
than ST-RAM anyway (about a factor of two in raw memory throughput).

If you have problems locating these, send me a mail.

There's a program called 'ataripic' that will meet your needs, it runs on a windows pc and is able to read most atari format pics then save them as .BMP format (which can be converted by paint shop pro etc)

get it here:
http://members.aol.com/tgkirk/pic3view.htm

hope this helps,

Phil.

>

AFAIK OLGA needs only multitasking and of course some OLGA
applications :-)
OLGA just communicates with simple GEM messages which have almost
nothing in common with the AV/VA protocol.

> OLGA stands for Object Linking for Gem Applications and is the Gem
> equivalent of OLE in Windows. The OLGA server runs in the background
and
> allows OLGA-aware apps to communicate. One simple example is the
CAB/Everest
> combination for HTML authoring; every time you save the file in
Everest it
> tells CAB to reload it so it updates in CAB automatically.

But only if CAB currently displays the HTML file. An example of an
application that uses both OLGA and VA/AV is the HomePage Penguin: it
uses OLGA if OLGA is present and VA/AV if there is no OLGA.

Greetings,
Matt.

Yes. So?

> And it's also not the fault of UseNet that
> there's broken/incomplete software out there.

Yes, it is. When messages are impermanent and can be retrieved from
multiple servers, total consistency is impossible.

> Well, just think how many disk space you (or the news server) would
> require to store all UseNet-message of the past ten years, even with all

You'd be supervised. Gigs are cheap now. And who says I keep /everything?/

> For yourself, if you use an offline newsreader, it's no problem to never
> delete old messages, or only kill them selectively, so you'll be able to
> return to old messages as well.

That's different, and less flexible.

> Crossposing is a fine thing, when used correctly (i.e. with a
> Followup-To:-Line in the header). Unfortunately, a lot of people don't
> know how to or don't care.

I disagree, largely, but maybe I've just never seen it done well.

> Anyway, what happens if you try to post a picture, maybe split into 100
> small parts, to "your" net?

You put it in the files list. It's binary; no need for ASCII of segments.

> > Where a newsgroup can be subdivided as many times as you like, and
> > remain as a single entity.
>
> Sorry, what's that supposed to mean?

cix:windows_nt (a conference => newsgroup)
cix:windows_nt/beginners (subtopic: no Usenet equivalent)
cix:windows_nt/chatter
cix:windows_nt/beta
cix:windows_nt/backoffice
cix:windows_nt/internet

> Maybe, but my original intention was to point out that UseNet does not
> have "poor threading", but there's poor software that "hides" threading
> information.

If I come back to a newsgroup after a week or two away and old messages
are gone, or someone comments to an old message in their local store that
isn't on the server any more, threading breaks.

That's a Usenet problem. That and the spam and the wibble and the risk of
getting an email address on a spammer's list and the binaries and the HTML
and the crossposts are why I don't use Usenet much.

It's just my opinion. Feel free to ignore it. I have no particular axe to
grind here; I'm sorry I mentioned it.

I have an idea for an 68000-emulator for FreeGEM, so that ST-family binaries could run on FreeGEM, with the GEM OS calls being passed through to the native OS and running at full speed.

Since one of the plans for FreeGEM is to remove Intel assembly language to make it portable to other CPUs, I think this could be a great opportunity for the Atari community. A full free legal version of GEM running on PowerPC or Alpha - or on cheap Intel hardware!

> Nicest sentence (about the ease of use): "The only computer which can't

Try Christian Grunenberg's LHarc-Shell 3.1. It's AV-aware, so files can
be dragged and dropped directly onto the interface -- much more
sophisticated than ST-ZIP's. There are other good reasons to use it, one
of them being that it can also output self-extracting archives.

I agree that core system software should be self-extracting. It must be
frustrating for a new user, for instance, to go looking for the AHDI
archive only to find it's in *.zoo format.

Good taste, Martin, about the other being better :-)

All fairly new Macs support *.lzh/*.lha files, because by default the
Mac OS CD-ROM installs Stuffit Expander, which handles these files just
fine. WinZip, on the other hand, requires an add-on (for registered
users) to handle the format.

Absolutely. And the best thing is that there is a SwiftCiX kit containing all you need, including a manual, to get you up and running with this great conferencing system. The kit should be available from the Atari Computing stand at Stafford in November.

>>And is only available in UK...
>
>One member of the Atari areas lives in Japan and accesses it from there.

Spot on - you can telnet into CiX from a local ISP and have CiX archive all your mesages for download to read later, offline.

PD fonts work fine in the latest version of Calamus SL99. Maybe what you
have are serialized fonts which are not serialized to your version of
Calamus???

Go check out Bengy Collin's Magic Online page. It has lots of info on Magic, MagicPC and MagicMac and links to all kinds of Magic related sites. It is at http://bengy.atari.org . In the commercial version you can assign any of your existing PC partitions as your HD in MagicPC. You can even specify a folder for example C:\Atari\ as your boot drive C. NVDI 5 is multiplatform. It works in Atari, PC and Macintosh versions. In the PC version it will also add better resolutions other than 640x480 16cols.

Joshua.

That's a step in the right direction towards modern systems, but support for LFN's is still lacking. The only utility that I know of is zip20, but there are seperate TTPs for archiving and unarchiving. Being a confirmed GEMmer I haven't attempted to use them as they stand, but OTOH I can't see any way of including them in a GEM shell either.

I am? It's hard to tell. I find the nocrew.org web pages almost totally
uninformative. I've never met so much obfuscation and jargon apparently
aimed at confusing the non-initiate as I have in the last few months as
I have been researching the Atari world.

It's *very* sad.

And surely, in any case, this is for Linux, not GEM?

>the blitter, since there would be no benefit in doing so.

I'm not sure how you determine whether NVDI is in fact using the
blitter or not but I observe the following behaviour on my MSTe with
NVDI 5, blitter and Matrix Coco VME card.

In video modes that the blitter knows about - i.e. ST modes and
monochrome modes on the Coco, the desktop shows the blitter to be ON.

In video modes that the blitter does not know about - i.e Coco colour
modes, the desktop shows the blitter to be OFF.

Since I am not the one doing the switching, I put this forward as
prima facie evidence that NVDI does use the blitter.

> Thank for any help.
>
> Karl

As I understand it, the Falcon has a serial port and a LAN port but only one can be active at a time? - Am I right? - Therefore you would not be able to connect your STe -> Falcon -> STFM using the serial ports.

So, probably your best bet is to setup a network using the MIDI ports to create a ring. You can then use STinG to provide you with TCP/IP and a rather good networking package called Bnet which will allow you to share drives and printers.

You will find STinG at : http://www.rottengatter.de/
And Bnet at : http://users.otenet.gr/~papval/

Hope this helps.

Don't confuse JavaScript with Java - two totally different languages.
And the answer to your question is no. You may view the page but CAB
won't display Java applets or use JavaScript.
There is no way around this at least not if you stick to CAB. Adamas
can use JavaScript though.

AFAIK, Java is a supposed platform independent 'add on' to HTML and Java script, is a language specific for one of the big two browsers, Netscape or Explorer enabling users of these/this to understand Java applets. Java needs a virtual engine (interpreter) built into the browser, the Atari systems are just too slow too even think of adding a virtual engine to CAB etc. Javascript, I think, being a much simpler subset of java, is just about usable with the high end ataris and Adamis has it.

If I'm wrong with the above, I'm sure some kind person :), will put me/you right.

It's even incredibly fast on a ppc 604 based machine then I can believe it's
two
or three times faster on a G3 and what can you imagine on a G4 ?.
MagiC Mac is the best thing which happened to atari users since a very long
time.
It's time all users recognize tis fact.

You don't need a browser or HTML to run Java. Java popularity grew with the web but it can be used just like any other language.

>is a language specific for one of the big two browsers, Netscape
> or Explorer enabling users of these/this to understand Java applets.

Netscape invented JavaScript and it was called LiveScript at the beginning. Only marketing reasons caused the renaming of Netscape's script language to "JavaScript". Because they are the inventors Netscape sets the JavaScript standard.
You can switch off JavaScript and still use Java applets and vice versa.

> Java needs a virtual engine (interpreter) built into the browser, the
> Atari systems are just too slow too even think of adding a virtual
> engine to CAB etc. Javascript, I think, being a much simpler subset of
> java, is just about usable with the high end ataris and Adamis has it.

JavaScript is so simple that it has something in common with almost every language i.e. JavaScript has elements of Perl, C, Java and Pascal with the simplicity of Basic. JS doesn't consume much memory but it really depends on the script you use e.g. a script which preloads dozens of images is slow but generally the speed is not an issue.

At least I've not had any speed problems on my Falcon which I wouldn't call high-end :-)

billyung> will be a deal breaker for me. I wonder if there's a way to somehow read
billyung> the logic from a pal so that it may be duplicated? Why would you even
billyung> need a pal? Everything should have been designed into the MMU.

It seems you don't know what you are talking about.

The TT ram card is plugged into a socket that has mainly the MC68030
CPU bus - there is no TT-RAM memory controller on the TT mainboard, so
you have to build your own.

Same for ST-RAM expansions in the TT: either you replace the onboard memory
chips by larger ones (this gives 8MB total, and the required chips are
difficult to get), or you add your own memory controller that
manages additional banks of ST-RAM. Only the second way is
plug-and-play, without soldering on the TT board.

Now of course building a DRAM controller with CPLDs is quite easy it
you know what you are doing, but it is a bit more effort than simply
putting some memory chips or SIMM sockets on a PCB - that's why none
of the guys which are selling such cards are willing to tell you how
to clone them ;-)

Hi All,

Unfortunately all the pages at ASH are in German :(and I wanted to get more informed about the latest version of MagiCPC. So if anyone knows where you can find some FAQs or any other docs translated to English, I'd appreciate if you let me know.

It is obvious from the demo version that you can set-up more than one HD partition (Laufwerk). In the commercial release, can you make some of them as Windows-Laufwerk instead of Laufwerks-Container?

Also, is NVDI PC same as NVDI 5. I think that it is supposed to increase the number of colors as well as overall performance of the PC version.

Thanks in advance.

No, both can be used at the same time. To hook a LAN-port to a normal RS232 just get a Mac modem-cable and a serial<->nullmodem adapter. My guess is that this will work fine with STiNG.

>time.
>It's time all users recognize tis fact.

On the long term MagicMac is the dead of the Atari scene. Once
you've a Mac or PC you probably won't investigate in new Atari soft. Why
should you do so? Will you spent money on an Atari browser now you can use
Netscape or whatever Mac/pc browser? No sire. Will you spent some money on
an Atari datebase, texteditor, spreadsheet, etc..? Most likely not. The
only reason why a Mac-user and a pc-user in a less attent still uses Atari
soft is because the Mac/pc counterparts of the Atari soft (read Calamus)
they use are very expensive, e.g. QuarkXpress, Adobe Photoshop.

Today I've done some work on my Brothers G3 running MagiCmac. Oh
boy, that thing makes me sick. It's surely fast. It's faster then my Hades
but try to print something on a pc-type lazerprinter. A simple all text
Calamus cdk (200 kb) takes almost 3 minutes/page to print out. There goes
your initial speed profit. I had some ZIP's with me. The MagiCMac had a
hard time to read them properly.
I don't know MagiCMac very well, so I'm maybe wrong on this, but I had to
switch back to the Mac environment to eject the Zip and to insert a new
one. Very handy isn't it?

Nothing can beat a real Atari. The future for us *Atarians* is the
Milan II not MagiCMac.

I'm using MPC 1.2 which isn't the latest version (but latest in English AFAIK). You do have the option of using either containers or mapping drive letters to Windows drives or Windows folders. The latter is very useful if you are lazy like me and just copy chunks of stuff over from your Atari: you can avoid having to set up all the paths etc again by just having folders mirroring your original Atari drives.

You just have to map things like the CD-ROM drive and Zip disk to make them fully available.

> Also, is NVDI PC same as NVDI 5. I think that it is supposed to
> increase the number of colors as well as overall performance of the PC
> version.

NVDI-PC was the PC version of NVDI4, which adds the extra colour support etc.

NVDI5 is an all-platform package, ie you use the same version for Ataris, PCs, Macs, graphics cards etc instead of the different versions for all those with 4, and it still adds the relevant enhancements AFAIK.

I can't speak for others, but right now, I can't buy anything new software (or hardware for that matter) without a lot of effort. I've bought damn near everything ever produced for this platform and continue to use this TT. But, sadly, I don't see any new development becoming available.

Heck, most of the Atari advocates here tout the availability of FREE Unix software being ported to MiNT not about the great new commercial packages available. :(

>try to print something on a pc-type lazerprinter. A simple all text
>Calamus cdk (200 kb) takes almost 3 minutes/page to print out.

The problem is not MagicMac nor Calamus but the slow serial interface. Connect the printer(s) to ethernet and the output is incredibly fast.

Oh, MacPrint makes this incredibly easy. Yes, one has to spend a bit more but this package is definitely worthwhile to anyone using Calamus under MagicMac.

Worse case, this is a single key-click, hardly a major incomvenience.

I haven't played with ZIPs enough on the Mac to know all the ins-and-outs myself, either. It's Anna's machine; she needed the portability for school. I'm just quite happy with the results we've managed to achieve!

To the best of my knowledge, Gajits Music Software changed name
to Software Technology, (and everything from here onwards I know
is correct) which is still around, though developing for the PC
(its current hot product being VAS - Virtual Analogue Synthesizer).
The company is now based in Stockport, a few miles from its
previous base in Manchester city centre. Not sure of the status of
Sequencer One but the more advanced relative, Breakthru, is still
a current product. Boss man of Software Technology is Greg. I don't
have a telephone number, best bet is to do a web search for the
company name and VAS.

Doc, I believe I told you how to have both a web based and IRC channel in the same chat room. Just check out http://www.quickchat.org they have a Javascript program that's an IRC client for their own server. I understand that CAB doesn't support Javascript but ST/TT users can still use any IRC program. Even 8-bitters can telnet to a shell account and use IRC from there.

I even have one on my web site at http://go.to/DeltaHouse - check it out under Contact Me! in the menu. It's free, easy to set up, and real fast :)

Hi All,
Two questions: (maybe same answer!)
1- Where can I get an XCONTROL panel (for the Falcon), that has a choice of the # of CPX's to load (from SETUP in panel)? Mine seems never to have had the feature which the manual says is there.

2- Some of my CPX's don't load!

Hi Martin,

MB>I really admire people like Erik Hï¿½ll, Jos den Bekker, Frank Naumann,
MB>Uwe Seimet, katherine Ellis, Thomas Binder, Odd Skanke, just to name a
MB>few Atari programmers who still support this platform.
yeah, but maybe you would be surprised if you knew the machines some of them are working with.

And remember: Buying a Mac or PC (I'll never get a PC as long as my TT is working and even when it dies, there is a second one for spare parts) means paying once while getting two computers (the emulators are not too expensive).

Having 'played' a little with teh Milan of a friend, I think that this machine is an excellent computer _when_ it's running. But 10 or 12 resets while copying my TeX installation (~ 100 MBs) seems (to me) too much instability). So I prefer a slow but st ble TT to a fast but instable Milan. I admit that's my very personal experience, but I'll keep an eye on the Milan development, and maybe next year...

One more problem: As the Milan has no soundchip (versus the Hades) printing software that directly operates on the parallel port (e.g. the two TeX ports) won't work. :-(

Peter

Hi John,

JK>A good point, but neither Heitman nor MUCS responds to my inquiries as
JK>to even buying it!
I downloaded the demo for a friend of mine who blamed MUCS for no
reaction at all. And on the phone they told him they were too busy to
sell it because there was too much work in order to prepare the "Messe
99" (Hannover)...

So his opinion is: I won't buy it if they won't sell it. We both will
have a look at it in Hannover.

Being a CAB user I think after some testing I don't really need
DRACONIS...

Linux is the equiv of TOS including the filesystems.
X is the equiv of AES & VDI.
Replace X by a suitable AES (oAESis) and you can run GEM programs on a 68K linux box. The AES calls the VDI, I suppose that the linux consoles use some kind of BIOS.

Exactly the same situation as with MiNT.
When you start the init program you have a Unixoid system.
When you start a AES you have a GEMoid system.
You can as well start both.

There is a new module for Calamus that allows access directly to the Mac printers and also to Power Print. Printing is much faster.

Only StarScreening an image is faster on a Hades aka 060 cause MagiCMac I think doesn't see the PPC fpu

1474. LAN-Port Aware Terminal Program?

Newsgroup: comp.sys.atari.st
Date: 1999-10-30 00:00:00 UTC
From: Derek Warren <macgod@rocketmail.com>
Message-ID: <291019992042222028%macgod@rocketmail.com>
Source record: 71358

Hello there..

Can anyone send me a copy (or a verified-working link) to a
communications program that supports the LAN port of the
Falcon/MSTe/TT?

I've tried ConNect '95 and '97 beta but they don't seem to support the
LAN port, despite claims on other pages...

Thanks!
Derek (new and improved with F030!)

That works!
Needs correct installation of HSModem.
CoNnect access the LAN-, modem2-, midi port well.
All testet with my own two falcons.

Connecting a modem to LAN needs a Mac Printer cable or pinout out of
DOITF030.

Regards, Robert

If you look around in any computer store (at least in the states), the
Atari name is everywhere. All the old classics now have 3d versions.
Now why didn't Atari think about this when they had the jaguar which
even today would be a competetive machine.

The "Ultimate Virus Killer 2000" is the industry standard virus killer for the Atari ST/TT/Falcon platform. The program has been around for well over a decade, and with the latest release (8.1) it's turned shareware.
There is now an official "UVK 2000" support site where you can download the program, find descriptions of all Atari TOS-platform computer viruses (and their symptoms) and more. It's located at http://uvk.atari.org.
This message is being sent to three newsgroups. If you think this constitutes spam, or if you think this message does not belong in your particular newsgroup, please contact me at cronos@atari.org and I will refrain from posting to the newgroup in the future.
Thanks for your time.

1484. ST News International Christmas Coding Convention 2000 (Atari ST/TT/Falcon scene)

Cross-posted to: alt.demogroups,alt.anybody,alt.www.sites,comp.sys.atari.st,alt.crews.atari

This message is to make you aware of the "ST News Lamentation Page", a site where the life and times of the Atari ST/TT/Falcon multi-media disk magazine "ST News" (1986-1996) are dwelled upon. It's located at "http://stnews.atari.org".

The site boasts the most complete gathering of "ST News"-related information, including an Ultimate Reference Guide, a download section where all 42 issues of "ST News" ever unleashed on mankind can be found, a gallery of pictures (including ones of quite a few people in the 'Atari scene') and a link to the "ST News International Christmas Coding Convention 2000" organisation and information site. To round it off, the site is littered with links to over 200 sites somehow related to "ST News" or the 'Atari Scene' in general.

The "ST News Lamentation Pages" are a huge success and have been visited thousands of times since their inception in May 1998. Come visit to see how alive and kicking the Atari still is!

>(or hardware for that matter) without a lot of effort. I've bought damn
>near everything ever produced for this platform and continue to use this
>TT. But, sadly, I don't see any new development becoming available.

IMHO this is exacly what I mean. People who has a Mac/PC will invest in Mac/pc soft and not or in a less attent in Atari soft. I would do exactly the same. The only reason why most (there are exceptions) people still try to use Atari soft on their Mac/pc is because they have spend a lot of money on some soft like Calamus SL.

Because lots of people are aborting the Atari scene every serious thinking programmer won't program for the Atari.
One must be some kind of lunatic to support this platform. Luckely there are still quit some lunatics around so we still can see from time to time new soft. I really admire people like Erik Hï¿½ll, Jos den Bekker, Frank Naumann, Uwe Seimet, katherine Ellis, Thomas Binder, Odd Skanke, just to name a few Atari programmers who still support this platform.
>
>Heck, most of the Atari advocates here tout the availability of FREE Unix
>software being ported to MiNT not about the great new commercial packages
>available. :(

I hope this will change once the Milan II or even the Phenix is on the market. My only fear is that new (commercial) soft will only run on one particular OS.
BTW: what's wrong with the Un*x soft? This is really great stuff. We only need some volumteers to make a nice GEM interface for these ports. The source are available so.....

Agree, but every additional click one must make is one too much. AFAIK it
isn't possible to eject a Zip if one is in magiCMac.

>Calamus???

Like Pat says all non-serialized Calamus fonts are useable with Calamus
SL.
However back in the early Calamus days some fonts were created with a font
editor which created bad fonts. Calamus 1.09 didn't bother about that bad
design and loaded the fonts. Calamus SL is however more accurate and hence
can't load these bad fonts. With the SL99 package comes a utility which
convert some bad fonts into useable fonts.

As for Draconis Pro (Demo version) I must say... I can't say anything 'cause on my Falcon (no matter which setup, MagiC or TOS) the install utility fails to write the all-important Adamas 1.6 p13 application (I asked the author: no reply...). As for Draconis 1.6 normal version I completely agree with Martin Byttebier: it crashes too often (not only Adamas but also the stack, which seems to be rather allergic to MagiC's Start folder applications (wbdaemon.prg, appline.app, partially cops.app...). Besides, I can't understand why so many demo restrictions in all the applications of the set. Wasn't it enough the 10 minutes one?

Nothing wrong with the Unix software. But, arguing that people won't support commercial software for the Atari if they can buy Mac/PC software from the same folks who constantly push FREE Unix software readily available seems a bit funny to me.

We've had very little problems with Zip disks moving files back and forth between the TT and the PowerBook. That said, we really haven't done it enough to know all the ins-and-outs of doing so.

Like I said, the PB is Anna's. I'm still here using this TT and watching the scene to see what develops.

ImageCopy 4.x does a great job of printing in color. It should support the
Canon. ImageCopy is a commercial program.

Well, I found my Sequencer One cover disk. However, it states clearly on the disk, in a README file, and on the program's title screen:

"THIS IS NOT PUBLIC DOMAIN!"

I seem to remember ST Format et al releasing certain software packages on cover disks that _were not_ public domain, and asking that you not make copies or upload the programs to BBSes/internet. This was one of those packages.

Now I don't know if the company that made it is still in business, but given that another person here posted that Sequencer One could still be purchased from an Atari dealer, I'm not sure I should make the cover disk version I have available for download for ethical / copyright reasons.

What do you people think?

I've done stuff for samplers, and fgrequewntly foubnd that there was a
small bunch of discrete logic kicking around on the boards...mostly 74F04's
and the like....I expect that the PAL's and GAL's artee just doing this
kinda buffereing but with fewer chips...I HOPE we're not looking at some
state-machine that's part of the MMU here...

Thoat sounds strange...MMU's are tightly integrate into OS's...I'd have
though that the PAL's or whatever are jsut buffering and not a state
machine MMU...

>
>Same for ST-RAM expansions in the TT: either you replace the onboard memory

>

No way I can believe this...if there's a way of extending the onboard RAM
to 8 MB just by a cghip change then the ST-RAM board PAL's are definitely
just buffers... there's a lot of reasons for doing it like this that I
won't go into, but the biggy is it's easy to ship positive excursion
signals around and re-create them but a lot of stuff uses
positive-on-ground on it's front end cos it's easier siliscon to
make...shgip the signal as positive high and invert/buffer up close to the
target chip...seen it lot son memoryt boards for other things....

OK, a DRAM controller isn't hard buit it can't be what's there if the
onboard controller will do 8Mb anyway...

1508. Inkjet Printers

Newsgroup: comp.sys.atari.st
Date: 1999-10-30 00:00:00 UTC
From: rwatson@zetnet.co.uk
Message-ID: <381b65c8$0$15722@news.zetnet.co.uk>
Source record: 71392

Hello

I have an STe with NVDI 5 recently installed and am wondering if anyone can help with the latest versions of Inkjet printers that are not exactly the ones that NVDI has drivers for. For instance, will the driver for a Canon BJC 4300 drive a BJC 4400, or an HP Deskjet 870 driver work with an 880? Is it ok to assume that if a printer of the makes that are supported by NVDI 5 works with DOS, then it will be ok under NVDI (but possibly without all the features)?

Any advise gratefully received.

Richard

Following on from this
I have recently installed NVDI 5 and am thinking of getting an inkjet
printer. Does anyone know which of the latest HP or Canon printers
work best. For instance will the driver for the HP Deskjet Colour 690
work with a 695? or a Canon BJC 4300 driver with a 4400. Is it OK to
suppose that any printer that responds to DOS commands will work?

Any thoughts gratefully received.

I agree self-extracting is the way to go for at least one of the TTPs,
but it does increase the filesize appreciably if used on several files.

If you get 2in1 it provides a graphical shell for all the usual TTPs -
ARC, ARJ, ZIP, LZH, ZOO (you need to have the binaries as well), also
allows you to make self-extracting archives from both ZIP and LZH
files, run programs such as UUE/UUD and pack (and unpack) program
files while leaving them executable. I believe the latest LZH is
faster, usually produces smaller archives than ZIP and allows recovery
of most contents in damaged archives, which ZIP doesn't (?).

Regards, /Peter/

This is not a blitter bug that occurs on original Atari hardware. This would sound to me like some sort of hardware fault. I think the original message was about problems with the blitter on machines with CPU accelerators. I do not think you can complain about Atari making the blitter incompatible with some accelerator boards, those boards probably didn't exist when Atari designed the blitter, and it was designed to operate with standard Atari hardware. In any case the blitter would be totally unnecessary when used with such an accelerator since it would be slower than the CPU.

Hi,

Was just wondering if it was possible to recieve a 14.4kbps webcast
through CAB to Aniplayer in real time?

Such as a .ram file.

This is on a Falcon.

Could this be possible?

many thanks for all replys

Paul Mac

1520. Re: Help for new Atari Mega ST2 owner??

Assumeing the Mega St2 operates as my St4:

For starters, you should get a desktop w/o a disk. It will show a
desktop faster if if a blank (or txt) disk is in the floppy drive.
Assuming you have access to the net (browser) on the computer you're
useing to get to this NG, one site to go to is:
Http://www.umich.edu/~archive/atari
You can also E-mail me (use swampfax@atlantic.net)

From: swampfax@earthlink.net
Message-ID: <7vij1e$kj1$2@fir.prod.itd.earthlink.net>
Source record: 71205

Hi All,
Got me a brand new keyboard (advertised as for an ST) which physically fits in my MegaSt4 case. Plug is on opposite end (does'nt reach socket). I moved the socket so it plugs in (same plug as the old kybd) however, the responses are all out of wack so (assuming the new kybd is good), is there a way to adapt it to work properly? The chips are the same but less parts. Number on the new kybd: C070236-011 (made in Japan).

Of *course* not!

> In any case the blitter would be
> totally unnecessary when used with such an accelerator since it would be
> slower than the CPU.

Again, of course!

What I was referring to was the apparent incompatibility of NVDI with blitters. However, even if it happens with accelerators instead *(or as well), it's poor quality control to ship with such issues.

Hi Richard,

RJW>For instance, will the driver for a Canon BJC 4300 drive a BJC 4400,
RJW>or an HP Deskjet 870 driver work with an 880?
I think it's worth a try!

RJW>Is it ok to assume that if a printer of the makes that are supported
RJW>by NVDI 5 works with DOS, then it will be ok under NVDI (but possibly
RJW>without all the features)?
I think working under DOS should mean it's possible to run it from an
Atari. Only GDI printers do need Windows!

Last bot not least, MAKEPRN permits you to or customize an existing
NVDI driver to your printer or even to create a new driver of that
kind...

I hate that graceful smile on a vendor's face when I tell him I'm
looking for a printer suitable to an Atari computer. :-(

When I bought my HP LJ 5L I became very insure when I recognized there
were bidirectional (parallel) cables to be sold with... But it works.
With an ordinary parallel cable. And now I don't know if I kept the
Windows CD delivered with teh printer ofr if I threw it away.

I don't like Windows.

Peter

I just found this newsgroup & have a couple questions. I have an Atari 1040 STE that I used from 1989-1993 to run EditTrak (MIDI program) for my band. I haven't used the machine in years, but I am wondering if there will be any problems with Y2K regarding either the computer or the software. I am very concerned about all the work I put into the songs & I don't want to loose the ability to play them in the future. Can anyone help me?

> each case).

The VCRs I was referring to aren't true multi-standard, relying on the TV to
do part of the work. Hence they are advertised as NTSC playback only, it
being a cheap fix rather than the real thing. I own one of these beasts but
have never had an NTSC tape to try in it, though the manual states that if
the TV isn't up to the job you'll get picture rolling and loss of colour.
Apparently you only get mono sound, too.

Yup, but they take the attitude that English info should be handled by their English-language distributors, ie System Solutions in the UK. Whose web site is rudimentary and who don't (yet) have any definite plans to release MPC 6 in English (I rang them yesterday; the person I spoke to suggested ringing their London office for confirmation tomorrow, which I will if I can get a moment).

> > You do have the option of using either containers or mapping drive
> > letters to Windows drives or Windows folders. The latter is very
>
> I guess this means that at the same time I can have two drives, where
> one is a Windows folder, and the other one is a Magic container?

You can have lots of drives, up to the MagiC limit, which is all 26 letters I think. Though A and B are for floppies and U is the "unified" file system (similar to MiNT's U). If you run TOS under MPC rather than MagiC you have to use containers for all the drives, but you get a drive O which gives you read-only access to the PC drives (haven't tried this myself).

> > can avoid having to set up all the paths etc again by just having
> > folders mirroring your original Atari drives
>
> What do you mean by this? Are you saying that if I had an Atari HDD, I
> could connect it to the PC?

Not as far as I know.

What I meant is that my STE has partitions C to M and a lot of stuff installed which relies on known paths to other things or bits of themselves, eg STinG, Everest (which is called by umpteen other programs), Calamus and Papyrus(which both have a bunch of paths set) etc. Rather than reinstall/reconfigure everything I just set up a bunch of folders which are mapped to the relevant drive letters and copied the stuff across. So Papyrus is still on H as it was on the STE, STinG is on I etc etc. So just about everything continued to work in the same way after copying it over. To access the PC stuff I mapped "My Documents" to J, the Windows font folder to K (set to read only to prevent NVDI mangling Windows fonts it doesn't get on with) and the CD and Zip drives to P and Q. I use a container for L which is used for temporary files, eg CAB's cache, Calamus's virtual memory etc, on

the basis that containers are supposed to be a little faster.

From: Nurmix@socal.SPAM
Message-ID: <7vg5ea$hdk@enews3.newsguy.com>
Source record: 71310

Hmmm...

I don't think about this much since I rarely have to change the clock on my Falcon. But here in the USA (and maybe the rest of the world too???), we set the clocks 1 hour ahead in the fall to give us more daylight ("Daylight Savings Time"). And in the Spring (tonight as a matter of fact), we set them 1 hour behind, or back to "standard time" - which is what got me thinking about this in the first place.

Anyway, before I used MagiC and COPS, I used to use plain old TOS and XCONTROL.ACC. Now XCONTROL has a section right at the top of the ACC itself where you manually enter time and date information. It just sort of occurred to me today that when using COPS, I don't have a way to change the clock or date (that _I_ can see).

I much prefer COPS over XCONTROL, so I figured there must be a little CPX out there that allows manually setting time and date information, right?

*And yes, I know I can just re-boot with XCONTROL to accomplish this, but that's not a proper solution now, is it?!

Everyone seems to want to ramble on about Hasbro resurrecting Atari's name for software, all that's going to do is ressurect Atari's past successes like PONG, Centipede and Missile command etc, Now in their day, yes that were great games etc. but even updating them to 32/64/128 or 256 bit standards for graphics/gameplay etc isn't going to help them compete with the like of Tomb raider, Quakes , bango kazooi, Sega rally dreamcast etc. because Atari has only a limited ammount of titles to select from, what going to happen when these dry up, where are the next sales going to come from, perhaps Atari should start selling old ocean or usgold or activision s/w or horror of horrors old CBM64 software from CBM themselves, or colecovision, nes or Sega MD or MS software- do you want this to happen don't you
After all if youv'e followed Atari history in software publishing, you'd know that Atari triedf this type of thing with Atarisoft (converting Atari hits to c64 speecy, amstrad,apple pc etc) and Atari Interactive (converting Atari hits to PS, Saturn and PC) and these futile attempts at getting Atari known as a software developer were only remarkable for their apparent failiures and also because they eventually lead to Atari being bought out or being sold off as a going concern
I accept the fact that Atari failed because of BAD MGMT (Warners & Tramiels resperctively) ABSOLUTELY no consistant and cohesive sales & marketing stragedgy or plans (Tramiels only), or total lack of product knowledge (Warners again) but the 2 main reasons why Atari failed is
A- Atari wasn't prepared to invest in the very technology that it had created, and this was reflected in the fact that heaps of projects were either scraped or put on indefinate hold this is because Atari was ingnorant about the technology it had created, and if one is ingnorant of what one has, then how can you invest in ingnorance (this applies to both the tramiel and Warner managements- And because Atari wasn't prepared to invest in it's own technology, it therefore couldn't advance the developoment of it's own products and therefore it's own technology, which basically turns Atari from a creator and pioneer/inventer in these technologies, into little more then a mass manuf.. of electronic boxes with outdated technology, very much in the same guise of the mentallity of virtually every manuf. of games systems and computer technology.. ie selling masses of plastic boxes with outdated technology, without intending to update or advance the product or in the very least it's technology... Who is conning who, the manufacturers conning the end users, or is it the other way round
After all, it's an established fact that consumers are a fickle bunch, and they no longer have the same loyalty for brands these days as they once did, if that was so then why are Jap co's like sega sony nintendo, dominating an industry, ultimately created by Atari, because- it cant be the technology- because these other manufacturers are essentially

putting Atari technology and design concepts, into theri own plastic electronic boxes, without advancing the development of product or it's technology, and if sega nintendo and sony stay on the same course any longer, they themselves will end up in the same situ. at our beloved atari, ie as a software producer
It's going to need a TRUELY ressurrected Atari (H/W and ALL) to breath some much needed life into a very stale and staid industry, and do something that the Atari of old and also these other so called games h/w manufs. haven't done and never did, and that's simply that Atari has to invest in the technology that it creates and to do that Atari needs to have confidence in the products, and instead of wasting money in ineffective advertising and marketing (which is what all previous Atari managements are guilty of), they should invest that money in advancing this new found technology, into modern standards, or tommorows standards, after all I remember someone telling me that technology designed today, or tommorow only lasts for ONE day
It's just a shame that no-one company has learned from Atari's mistakes and folly, they may think they have but they haven't
After all, you can take a look at any company product or service (doesn't have to be computers or v/g's) and just have a look at how the company views the product or service, after all if you don't have a prod. or svc. you have nothing to sell, nothing to sell= no business, the mistake that companies make these days, is that they've got to modify their sales/marketing, or they've got the snowball the consumer/end user with advertising, or that they've got to change their customer service/customer care program (if they have one) now I admit that these areas of business are very important, but what modern business (Atari included) has overlooked and there fore the most important, is the product or service and USP's/features and benefits are all well and good, but if you are not investing in the future development of your companies product or service, then USPs, features etc are irrelevant and pointless, also why should the consumer buy your products, after all the ultimate investor in any idea, product or service is the person or persons that buy's the idea/prod. or svc, this is called the consumer. and not the company doing the selling.. After all as the consumer is the ultimate investor, surely the consumer has a vested interest in the future development of that product or service, after all the consumer has just invested money in the company, the consumer needs confidence that the company will invest these funds effectively, and looking at it logically, if the company isn't interested in investing in advancing the development of the product or service and in the p/s related technologies, then will the consumer come back tommorow and buy the companies product again, what do you think (after all would you buy the same product using the same technology fromn the same comnpany say in 20 years or in 2 months from now, when you know that their competitors have vastly better products, and they are investing in advancing development of their p/s and related technologies- I DON'T THINK YOU WOULD), by investing in the product and it's technology and development, you are investing in future custom, future custom= more investment in advancing development and technology

in their p/s, only once this is investment framework is
firmly established, then the company then can start investing in
supporting the product, in regards to marketing, advertising, sales,
customer service/care etc, and not the other way arround, which is what
virtually every single company is doing including those outside of the
computing and v'g h/w ind.. After all if companies follow their current
path they will be doing nothing more then making little more then
electronic plastic boxes with outdated technologies, with a very limited
market potential, youv'e all heard of the old saying about flogging dead
horses and ever decreasing circles, think about it each time you go
arround the block, selling the same prod. and each time you do this,
they investment you get (ie people buying the product) isn't being
invested in the godds/services themselves the more times you go arround
the less you sell, you#ll get to the point where your'e not selling, as
you have no product as it's now like flogging dead horses
Tied in with this reason, i refer to a listing that i saw in an American
Business Directory (those Dunn & Bradstreet type jobbies), I remember a
listing for a US company i think it was a small incorporated cloting
company, had a look at it's personnel listing (8 snr vice pres. 5 Exec.
vice pres. 15 vice pres) now your most probably saying, so what, now if
this is for a small cloting co. I'd hate to think of what the numbers
would look like for a larger US multinational- for just one of the US
offices, take a guess 4, 5 or 6 x, or how about 10 or 20 x, and remember
that these people people were hired and put into these positions of
responsibility because they were good at making 'DECISIONS', now think
of this structure, a manager, he has to report to a manager, he then
reports to a manager, who reports to a manager, in another department,
who reports to a manager, her then reports to a manager, who reports to
a manager in another department, and so on and so forth till you get to
the top, and just imagine this same process happening when one
department needs a decision on a new idea in advancing devlopment in
existing product(s) and it's related technology, all it needs is one
manager, be it a VP, SVP or EVP from the same dept, or a related dept or
even a total unrelated dept who have alterior motives to say no, and
that wipes out the entire efforts of one or several entire
divisions/dept... and for what, short term prestige/gains, what about
the long term, what about the continued survival of their product in the
face of competing products (from companies with lesser rigid structures
and also beleive in investing in their p/s future advances and
developement), and not only thant but how will this other company
survive, whats going to happen to the structure of decision making, the
future of their product (so far as advances and deveopments are
concerned), creativity and commitment to the company itself, all that's
going to happen is people will leave, because the company isn't
interested in the product and it's future the people will not have faith
or confidence in the direction the company is taking, it's decision
making process, there will be no creativity and therefore no committment
Essentially the companies structure becomes beaurocratic and therefore
area's like creativity, product advancement and development, decision
making and committment are stifled, to such an extent it drives people

to leave, which is ironic because, wasn't it these very same people that got the company and the product/service to where it is today, and remembering the concept about the consumer being the ultimate investor, if this is so then the penultimate investor is the employees (who have as much vested interest in the future developement and advancement in the companies product/service)and what happens when they leave, everyone moves up one, but the problems stay the say, and because virtually all companies have the same philsophy, are these people who are leaving, going to join their competitors, i don't think so, all that will happen is that they will set up their own company, selling the same prod/serv., wtih the same technology (because they don't yet have the investment to advance the tech.) so straight of the bat they allready in a hole facing an uphill struggle to compete with est'd names, in an ever decreasing market (I was once told that the average market share for any new entrant to any market for the first 5 years is the equivalent to the ammount of brain capacity as used by human beings which is less than 10%, my thought is, is it realy worth it) and because more and more companies are competing for less and less market share (in the same market-ie USA etc) all it will need is a foreign competitor to advance and develope the same product with new technologies, and actually invest in it- and they've virtually got the market sown up, because existing users aren't going to wait while their current suppliers start advancing their product, irrespective and regardless of the quality or their sales/marketing/advertising/customer care/service, because as you remember consumers are very fickle, they want the latest thing, which means they will go with whichever company is prepared to invest in it's own product (thru advances in product/service development and related technologies-thus investing their customer investment wisely/effectively), so therefore theres always going to be a decline in so call brands loyalty- You cannot compute, eat, see or sleep image, or marketing or sales or advertising or customer service/care, these are things that are earnt or created as a resulting of investments made by the consumer, the only way you can create or earn image, marketing, sales ,advertising or customer service/care is by investing in your customers confidence and faith in the future advances and development in the prod./serv., and the only way a self respecting company can invest in this concept, is by doing so.... but no-ones doing so, so ultimately instead of going forward into the '3rd Millenium' we might as well go back to the 1st millenium
Atari failed simply because of what I outlined above, little of no investment in advancing their product and related technologies, little or no creativity, no commitment to atari's concepts, to beaurocratic, you might as well say that virtually every company involved in video games h/w of s/w was born and created on the back of Atari's technology, and unless they change their ways they will suffer the same indignity
Yes, we are still using Atari technology, but it's in someone elses plastic electronic box, sold just like baked beans, jeans, perfume... wheres the sense in that... I though Atari's represented computers and video games h/w with a personality- ie Atari technology in Atari boxes, and not someone elses, BUT with Atari investing in the future advances

and development of their (ATARI'S) product and it's related technologies

The second reason why atari failed is because the American consumer simply gave up on Atari, they didn't like the idea about Atari, an American company dominating an industry that Atari itself had created, so they showed their support to ATARI, by buying sega, nintendo and eventually sony or to put it another way buying, Atari technology in someone elses boxes
interesting when you consider that Sony, Sega & nintendo are JAPANESE companies, and I am constantly told that American's cant stand buying JAP goods (talk about contradiction big time), and according to most european and US computing press and commentary during the tramiel era, it was the European markets (incl.UK) that was keeping Atari going (or at least alive and surviving) whilst you American's were content in buying Sega sony and nintendo, or buying, Atari technology in someone elses boxes

perhaps I am wrong, there again I live in a so called democratic country (England) so i guess with the so called freedom of speach concept (what-freedom of speach- democracy- england, you are joking aren't you) anyway I guess i'm entitled to my opinion, even if others don't neccessarily aggree... But in saying that, as anyone who has an ounce of HUMAN intelligence will know, sooner or latest this internet thing with simply become an unweildy authority with an unweildy institutionalised mentallity

I'd like some info on the Atari PC series. To my understanding there are a few models, the PC-1, PC-2, PC-3, PC-4, PC-5 and ABC. I hear that some of the models have Atari's own PC-compatible motherboards while other's have generic mobos. Are the generic ones your typical AT motherboards? If that's the case, I'm interested in buying the system and installing the latest AT mobo in it and build myself a blazing fast Atari PC. So, somebody please give me some info.

Joshua.

I could set up IRC server on my domain. I have a static IP and good bandwidth on my system. IRC, being 100% text based, is very light on bandwidth requirements, especially when it would only host us hardcore Atari 8 people.

You would have Op status. It goes without saying I would have the final say in matters related to the server but I would let you Op/moderate it. I am not sure about scripts though. I can set up a deal where you can always get ops by use of a PW.

I would do this only as to be a benefit to the old die hard Atari8 community, for which I have long developed kinship and respect for. I have no personal objective or motive of gain (for myself) of any type.

Let me know what you think. Everyone else is invited to comment also.

Jon

That's an idea too. So long as someone carries the torch. I prefer,
no, I STRONGLY prefer IRC based chat as opposed to web based though.
Web based is so awkward compared to IRC based.

: though that the PAL's or whatever are jsut buffering and not a state
: machine MMU...

This "MMU" is simply a DRAM controller. It has nothing to do with the OS. The TT RAM socket brings out the 030 processor bus onto its pins. If you want to attach DRAM you need a controller to, among other things, generate the correct DRAM control signals (which are different to those used by the 030 CPU) and buffer the address bus since DRAM addresses are multiplexed.

Normally you would use a standard part and not a PAL for "just buffering." A PAL chip would normally be used to implement more complicated logic functions than a buffer.

I will not comment on the ST RAM in the TT because I am not familiar with that. Except to say that to me everything that Mr. Schwingen wrote seems entirely reasonable.

Apex Multimedia.
But that isnï¿½t the point, needï¿½s a hardware like a "srcreeneye" or an
"expose" to pick up the pictures from tape or any other video source.
Falcon need an hardware digitizer to make the job.

Sell my screeneye in first quater of this year.

Picture quality was still good, both expansions.
"Apex" is the one and only software i knew what can take digitized
pictures direcly from the hardware.

Expensiv! Both expansions..
(Also as used/second hand units!)

A CPX file called "CLOCK_E.CPX" came with the COPS version in NVDI 5. You
should be able to find it on the NVDI and COPS web site or on FTP sites.

Depends where you got COPS. The version that comes with MagiC (at least MPC
and MagiC 5/Atari) just comes bare, the version that came with NVDI-PC
actually comes with a CPX called clock_e.cpx which gives you the time/date
functions (with some enhancements). Might pay to download a later version
just to get the CPX (I think the URL for Thomas Much is www.snailshell.de).
Must admit I only found this by accident (this week as it happens) as I'd
installed the copy that came with MagiC and assumed the NVDI one was the
same as they were bought about teh same time. Obviously enough users had
complained that they needed the date/time setter!

The latest (and last) version of the Studio Module is 1.07. And no - I couldn't find it on the Steinberg site either. At first the Steinberg UK dealer denied all knowledge of it, but the fact that it exists is posted on the Steinberg site - but only the German one.

Persist with your dealer. If you get stuck, I don't mind emailing you a copy since it won't work without the original disk, so it will be no use to anyone who hasn't paid for it!

TORONTO ATARI FEDERATION FLEA MARKET NOVEMBER 17TH!

Yes, folks, it's time once again for users of the classic Atari 8-bit, ST, TT and Falcon computers to come to the annual event where you can divest yourself of what you don't need while at the same time hunt out for what you do! Sell your old stuff, discover a treasure!

Among other things you'll find at this event:

classic systems! Looking for that Falcon? Wished you had an STe and its expanded capabilities? Do you need a 600XL for your collection? There's a good chance you'll find it here!

hard-to-find games, peripherals, literature and applications!

TAF Software Library, carrying hundreds of PD/Shareware games, utilities applications, as well as the TAF Internet discs! Plus we'll be selling 720K floppy disks, stock up! The membership desk will also be up for renewals as well as new members.

the camaraderie of fellow Atari users - swap stories, troubleshoot, ask for advice! Meet some of the faces you've only read online on the Internet!

Ken Macdonald's demonstrations and sales of the various Mario Becroft adaptors for Ataris. Use a PC three-button mouse with the Mouse Adaptor, plug & play, works with Ataris and Amigas! Use a PC keyboard, PC mouse and Atari joystick with the amazing new QwertyX adaptor, no soldering required! Give your ST or STe amazing storage capacity with the Internal IDE Adaptor kit - program storage, add a CD-ROM, use an LS-120 internal drive to replace your disk drive! And, with the VGA Adaptor, use any VGA or SVGA PC monitor with your Atari ST to get a beautiful hi-res display!

All this and MORE!

It's a night of fun and commerce, and it's being brought on by the one, the only, Toronto Atari Federation - bringing you the best in Atari-related computer info and enjoyment since 1984! See you there!

Flea Market details:

Admission and tables for TAF members: Free
Admission for non-members - $2.00 (one thin toonie)
Tables for non-members - $5.00 (admission waived if you purchase a table.

NO STOLEN ITEMS OR PIRATED SOFTWARE ALLOWED! VIOLATORS WILL BE PROSECUTED TO THE FULL EXTENT OF THE LAW.

TORONTO ATARI FEDERATION meetings are held on the third Wednsday of the month from Sept-June in the "Gold Room" of the North York Memorial Hall located in the lower or concourse level of the North York City Centre Library Building at 5110 Yonge Street (next to Mel Lastman Square) at Parkholme Avenue. Those coming by public transport can take the TTC Yonge Line north to North York Centre Station. $2 for non-members. Dues are $25 per year, and includes a subscription to the newsletter PHOENIX. Membership in TAF IS Atari support!

1554. Obsession on PC

Newsgroup: comp.sys.atari.st
Date: 1999-10-31 00:00:00 UTC
From: Keith Lever <keith@lever.freeserve.co.uk>
Message-ID: <7vhqp3$423$1@news5.svr.pol.co.uk>
Source record: 71331

Hi there all.

I don't know how many of you are prepared to admit that you also have a PC,
or whether you play OBSESSION.

Anyway, for those who have, and like the game, It has been released FREE for
the PC on a PC coverdisk.

The magazine you want is PC Advisor issue 51.
Their website is http://www.pcadvisor.co.uk

The game is now called ABSOLUTE PINBALL.

It plays superbly, and the sound is even the same.

Hope this helps someone.

All the very best,

Keith & Laura Lever.

Alyre - am using "CKBD.PRG" on my TT without any problems. It is possible
that it is sensitive to Auto folder placement.

Me too (prefer COPS, that)! There *is* a Clock CPX distributed with COPS.
If you can't find it, let me know and I'll send it your way.

Also, if you are using STing there is a great little program,
T_BATCLK.DOC, which can be used to automate the setting of your clock each
time you connect to the internet. It should be on Ronald Andersson's page
because he is the author.

Speaking of Ronald's site, be sure to check it often. STing, TCP and UDP
modules are going through rapid development of late and I have seen no
formal announcements here. Actually, Ronald has been very quiet of late
but, obviously, very active in the background.

hello!

i just acquired a 1988 Atari Mega ST, with NO discs/software whatsoever,
and was wondering if anyone could step me thru getting it up and
running?

it came with a keyboard, a mouse, and a color monitor (SC1224).
everything turns on, but i don't have a boot disc.

please let me know if you need further info, and also if you could email
me directly that would be appreciated.

thanks!
pea hicks

1560. FS1040 STE sytem and software

Newsgroup: comp.sys.atari.st
Date: 1999-10-31 00:00:00 UTC
From: David Smith <david@suscom.net>
Message-ID: <381C8363.343C5918@suscom.net>
Source record: 71337

I have a complete system I would like to sell. Everything works. I
will accept offers for the complete system and for individual parts.
---
*Atari 1040STE.
Complete, in box, including mouse, manual and STE language disk. 4MB
ram, Tos 1.6.
*Atari SC1224. Color monitor.
*Atari SM124. Monochrome monitor.
*Atari SF314. 720 external floppy. Complete, in box, with cable, power
supply and manual.

*Practical Solutions Mouse Master. Plugs into mouse/joystick ports
under keyboard, providing easy access to joystick ports and providing
switch selectable mouse or joystick on port 0.

*Practical Solutions Monitor Master. switch to select between SC1224
and SM124, without unplugging.
---
additional items for sale. all software runs on an ST with TOS in ROM
and 512 KB memory unless noted otherwise. all software with original
documentation and box unless noted otherwise.

*Alfa Data Track Ball for Atari ST and Amiga. 3 button track ball. New
in box, not used. For years, I have had one of these connected to my
1040STf and consider it be the finest trackball offered for the ST.

*Art & Film Director by Epyx. The program that combines a full range of
both paint and animation features in one affordable package.

*Phasar 4.0 by Antic Software. The professional home accounting system
and register.

*PrintMaster Plus by Unison World. Everything you need to design and
print banners, calendars, greeting cards, custom stationery, posters,
flyers, invitations and logos.
*Fonts and Borders for PrintMaster Plus. 20 additional fonts and
borders.
*PrintMaster Art Gallery I
*PrintMaster Art Gallery II

*STalker 3 by Gribnif Software. STalker is a complete, easy to use,
telecommunications and terminal emulation program. It Fully utilizes
the Atari's GEM interface.

*1ST Word Plus by GST Software. v2.02. Nice, full featured
document/word processor with graphics import ability.

*DB Master One by Stoneware. Basic database program, easy to use.

*OutBurST 3.0 from Straight Edge Software. A Printout Accelerator. Significantly reduces the time that it takes to print out. no box

*DC Shower v1 from Double Click Software. DC Shower can view any text file, binary file, picture file or even extract ARC, LZH, ZIP and ZOO fills, the desktop or in a program. no box.

*ExtenDOS Pro v2.4A. access standard SO9660 CD-ROM as a large hard drive. Single and multi-session photo CDs are supported on most current drives. no box.

*Cyper Texture from Antic Software. Turn you DEGAS, NeoChrome pictures or CYBER PAINT animation's into CAD-CD objects. New, in unopened box. 1 meg memory required.
*Cyber Paint from Pro Animation Studio. works with all ST paint programs. Cyber Paint is a cel animation/paint program. New, in unopened box. 1 meg memory required.

Please respond the email. I reserve the right to refuse any offer. All hardware and software, except for unopened boxes, have been used by me and do work. However, all are sold without any warranty.

Yup, TosBox is fine but it won't run Magic. There IS a demo (very few
restrictions) of Gemulator on www.emulators.com. I am still struggling to
get this to display properly on this PC but I think my problem is my
graphics card (ATI) rather than the emulator.

I see.

Interesting if you want an - arguably - enhanced platform for GEM applications on old 68K hardware, yes.

Not very relevant to enhancing a current and active version of GEM itself for the most popular (and therefore cheapest and most widely-available) platform in the computer world, though.

If it had one, yes - but earlier STFMs didn't have one - only the
solder-pads for fitting a socket on the later TOS 1.04 machines. I
purchased a socket and blitter from Best Electronics and fitted it with
no problems - you also have to change a couple of solder brigers, IIRC.

Email Brad Koda on bestelect@concentric.com for prices - he accepts
credit card payments.

>60Hz is available as it's the North American standard for AC mains and hence
>TV refresh rates (this goes back to the days before TVs used chips to
>generate the scan frequency; they originally used the mains frequency,
>AIUI).

Not quite - *very* early TVs had a problem with EHT smoothing and gave a rolling hum-bar if the vertical scanning was not locked to the mains; in those the EHT was generated directly from the mains, and it was expensive to produce the large smoothing capacitors required at the several kilovolt rating to give good enough smoothing. When locked to the mains, the bar was still there, but virtually invisible as it did not move (I am not sure how things worked on the other side of the Atlantic, but in the UK the whole of the mains distribution network was synchronised).

The link between mains and scanning frequencies had to be broken when colour was introduced in the US, because the colour subcarrier had to be a multiple of the line frequency with a half-line offset so that the colour information didn't produce dot-crawl on mono receivers. That made the vertical sdcanning frequency something like 59.97 Hz IIRC. In UK I think the link was broken when we changed from 405 to 625 lines. In any case, by the fifties (or so) EHT was no longer generated directly from the mains but obtained from the line flyback energy of the scan coils. The much higher frequency (15.625 KHz) allowed much smaller capacitors to give adequate smoothing.

Also, though I agree modern TV sets will reproduce NTSC, they only approximate it as they don't normally have the correct colour decoder fitted; same goes for most modern VCRs (unless sold as multi-standard in each case).

Few things to say to your post.

1. Wanted to reply to let you know at least someone out there was having a lazy enough evening to actually read it.

2. Atari is still a name in the US. Probably to some extent in most of the developed world. Now is that an image of the ST... no. Is it an image of a Jaguar... no. Is it an image of a lynx... no. Is it an image from the early days where if you had a vide game in your house it was an atari... Yes. This is what Hasbro wants I can only assume. A name that while tarnished and stained does have a very important thing in our consumer economies... recognition. If it wasn't for Atari buff's like us (and a few people that seem to hate the last 25 of us still using them like old sinclap), telling people that it's really Hasbro and not Atari behind those commercials, they wouldn't know.

3. I would love to see Hasbro do something with the last incarnation of Atari's stuff. Production or development would be outstanding and I wouldn't know how to contain myself. But if we couldn't get that, just opensourcing whatever they could find would be great. To tell the truth if they don't care about the computer end of their atari assests, then what is the source code to TOS or Atari Works or anyother application really worth to them? Nothing. This was the problem with the Tramiels in the end. Several companies (small companies all be it) tried to buy the computer end from them, after Atari Corp. stated they were out of computers. What did the Tramiel management do? Use the convoluted nature of the US legal system in regards to corporations to steal money from them. I know of at least one compnay that was allegedly bilked out of several million dollars (less than what atari finally sold for I believe) do to the nature of atari's management and dealings. And what good did it do atari in the end? Nothing other than they could pay their bills for a few months longer.

4. In my opinion outside of some potential for limited set top box applications the only real assest that Hasbro got from Atari in the hardware field was the Lynx. Don't say the jaguar they were cool and I still have 2 of them, but compared to my 2 year N64 they are toys. The lynx however still stands up well compared to the Gameboy. It's kind of sad that a machine that hasn't been manufactured for years beats the current and best that Nintendo has to offer. I really think with their markieting backbone and some updates in technology the lynx could still be a money maker for them.

Well that's my two pages worth...

: What I was referring to was the apparent incompatibility of NVDI with
: blitters. However, even if it happens with accelerators instead *(or as
: well), it's poor quality control to ship with such issues.

To my knowledge NVDI has no compatibility problems with the blitter. I have never heard of such a thing. You are probably thinking of the fact that NVDI doesn't use the blitter for drawing graphics because this would not be faster than using the CPU.

It is not bad quality control on Atari's part: they shipped blitters that work with Atari hardware.

I don't think this is a problem with third-party hardware either. If it was not designed to be compatible with the blitter then you can't expect it to be compatible. If it was claimed to be compatible with the blitter but wasn't, that is another matter.

1572. Newer VGA monitors with an ST?

Newsgroup: comp.sys.atari.st
Date: 1999-11-01 00:00:00 UTC
From: Micah Brunt <mbrunt@earthlink.net>
Message-ID: <381D5A6B.54209723@earthlink.net>
Source record: 71220
Cross-posted to: comp.sys.atari.st,comp.sys.atari.st.tech

While trying (very unsuccessfully) to go to sleep just now, I was thinking of ways to cut down on my loads of electronic clutter here in the casa. One thing I'd like to do is get rid of my two old ST monitors, but I don't want to replace them with an almost equally as old and dysfunctional VGA monitor..

So, I was wondering if someone could give some input on an idea: Would it be possible to make a circuit to multiply the video frequency coming out of the ST? ie, potentially by sending each screen refresh twice in order to double the frequency? This used in combination with the Atari->VGA converter cables could conceivably allow the use of more modern VGA monitors that have higher refresh frequency ranges..

(See, I'd love to hook my Atari to my 17" Princeton Graphics monitor here..)

Any ideas on how/if this could be done?

micah

Using Jinnee (the default MagiCMac desktop) pressing [CTRL Y] ejects the ZIP drive. You can reach this option also via the desktop entry, section object.

1575. MyMail

Newsgroup: comp.sys.atari.st
Date: 1999-11-01 00:00:00 UTC
From: Bob King <robert.king@patent.gov.uk>
Message-ID: <381D6E84.4C6701B@patent.gov.uk>
Source record: 71223

I cannot get MyMail (latest version) connected to the Internet (my ISP is Zetnet), I connect using Sting as usual (this works for CAB and Newsie), but get a time out from Mymail and/or a message that something (I can't remember what) can't be openned. The HTML help file indicates that MyMail needs to communicate with dialer.app or dialer.acc using the va protocol and that I should set up an environment file. I have set up the server, browser and dialer strings like:

#SERVER=MAGXDESK

in the environment section of MAGX.INF, and run in Magic, but no joy. How exactly do I connect using MyMail. Newsie is so simple, just click on 'Connect to server', but I want to use MyMail, it looks so much nicer.

Bob King.

No, I wasn't. I am not that easily confused! However, reading back up this thread, it seems I have misinterpreted some messages, such as Derryck referring to the desktop crashing on menu access.

Hmmm... It will be very complicated. I think that you should think about buying Atari Falcon, which (as I know) has VGA output built in. Of course there are some graphic cards too, but it's same story (complications, expensive).

Pera

Just for fun try replacing your system clock quartz with faster.
If you had upgraded your RAM with faster chips (60-70 ns), it might even work on
twice the original speed. Oh yes, for that you need TOS in 120ns or faster ROMs. That way, both your colour resolutions would fall in the 31 kHz region and you could have up to 120 Hz vertical refresh.
Mono resolution would work only on the best monitors, since its HS would be around 70 kHz and vertical refresh 144 Hz ! Overscan should be able to get at least 1024x768 at 90ish Hz or even 1280x1024 at almost 66 Hz or so...(theoretically-I haven't tried this)
It would be very interesting to see Overscan under these conditions, not to mention twice faster CPU.
Off course, yo would still have to several little problems, like FDC clock, sound generator clock, keyboard clock etc. but fixing these should be trivial.
One more problem is that ST's video circuitry has two video outputs-monochrome and RGB and only one of them can be active at any moment. This is also true on videoshifter itself, which generates digital video information (3 bits for R,G and B and 1 bit for mono) and shifter always puts unused outputs into logical 0 when inactive. So, the simplest solution would be to make small adapter and fit in it shifter chip itself and then fit adapter back into ST's mainboard. Adapter does nothing special except ORing each colour pin from video shifter chip with monochrome output from videoshifter chip and feeding the output to the corresponding pin in the socket on the ST's mainboard. All you need is 9 OR gates, which means 3 74HCT32 chips would do the trick and you would have a few gates to spend on buffering monochrome signal, since it has to drive 9 extra CMOS inputs. As I wrote, I have very succesfully used 74HCT series for that purpose, but you might be better off with 74ACT, since you would work on twice the clock rate...
Oh yes, one more thing. I have connected my ST on EGA monitor that way without frequency doubling (it still worked on 8Mhz) and results vere fine except nasty vertical raste in picture which was more pronounced in colour resolutions. I have tried everything just to find out that videoshifter chip was placed on the mainboard wrong way around so that it's own databus have caused severe noise on colour output lines and D/A circuitry. Since there is some 5 resistors, 1 transistor and noth much else per D/A, I have moved all 3 D/A's on the adapter circuit and result was unbelievable!

I hope the answer is not too long,

Branko

I'm not sure if many people still play MidiMaze II out there, but I figure this is one of the better ways to reach them. :)

MMUTIL32 is a program for the Windows 9x/NT console that converts files between three formats: MidiMaze, MidiMaze II Encrypted, and an editable text file which allows for the extra information contained in a MidiMaze II maze. Mazes made from MMUTIL32 can work with the Freeware and Registered versions of MidiMaze II.

You can get a more information or download a copy at:

http://www.pconline.com/~parody/

I hope you find it as useful as our group has,

No, this doesn't work at all. If I do the floppy is ejected and not the
Zipdrive. I also tried to select the drive first and then to press that
key shortcut. No way I can eject that zip.

Yep. The way round that was to install better rated buffer ICs in those STs that exhibited this problem, which makes installing a Blitter and a CPU accelerator even less a plug'n'play proposition.

I think so too, but it may not be possible to access certain features of the printer without being able to run the utility disk, for example I can't adjust the positioning of the colour and black carts in my HP660C printer. Luckily the registration always seems to be spot on! :-)

>Last bot not least, MAKEPRN permits you to or customize an existing NVDI driver to
>your printer or even to create a new driver of that kind...

That utility isn't included with NVDI5 unfortunately.

Disks or CDs included with printers often have TTF fonts which can be copied across and used with good effect under NVDI BTW.

Translated docs and utility progs are on my website Steve.

It's not difficult to install but quite tricky to find the right place to solder the wire from the card to the motherboard - my ST didn't match any of the ones pictured. I'm afraid that I can't remember to which IC or pin it connected to.

You don't need a boot disk: the OS is in ROM. Just plug the monitor into the machine and switch on: after a couple of minutes you'll get a desktop. It will boot much more quickly with a disk in the drive, though.

Your three best resources for finding software and advice:

Haven't they dropped MAKEPRN from NVDI5, due to some printer manufacturers refusing to release details for creating the included drivers to 2B unless it was impossible for a user to see the control codes?

Silly, IMHO; what's soooooo secret about control codes for printers? You'd think they'd want as many people as possible to use the things, but no.

I believe Canon for one now charge some loopy sum for a second manual for recent models to get the codes, which used to just be in the standard manual for older models.

Such a policy makes it just about impossible to use these printers with anything but Windows even when they aren't GDI printers, which is of course becoming an issue with the increasing use of Linux etc.

thanks I have Magic PC but as with MagicAT it won't run some early stuff
Tosbox did and a bonus stuff that wouldn't work on a real tos 2.06 works on
it,I downloaded the Gemulator demo three times I think it's faulty as it
just goes to 400/800 emulation and wont even let me choose ste etc

Audio Tracker can record analogue or two types of digital
signal: ADAT or S/PDIF. You need the appropriate SoundPool
interfaces for the latter two (which may also be chained
together in the same system).

Should you been using Magic [+NVDI] you could always try
to suit the KEYTABLS.sys according to your preferences.

I have the 18 = 2x9 Polish 'ogonki' placed on my numerical
keypad [instead of 1-9]. Within the .sys file you should
have for every 'key' the corresponding 'ASCII' number [I use
the ISO-LAtin 2 or ISO-8859-2 standard, but I would suggest you
stick to ISO-8859-1 for your French accents]

I had some problems reading the german doc (I am italian), is there a way to use two modems with MagiCMac ?
I would like to leave a faxreceiver alwais on on a line even when I use MagiCMac with a comm program (NOS)
I have a Quadra800
I could:
- have a Mac faxreceiver on printer port active even while MagiCMac is running and doing (or not) communications on modem port
- have both the faxreceiver and comms program with MagiCMac running, one modem on modem port and the other on printer port

but I do not know: how ?? can I use the two ports under magicmac ? can a faxreceiver program work in background while MagiCMac is doing other jobs ?

Dan,
I think the keyword in your post is 'marketing'. If I'm not
mistaken, Atari was the least important of a few companies the
Tramiels owned. Here in the USA, a littled national advertising (which
I believe they wanted the dealers to pay for) would have gone a long
way to keep the dealers in business and also keep all those programmers
Atari owners lost.
From the streets: Duh! Atari computers? Oh yea, Space Invaders!!!

> > *Milan II* not MagiCMac.
>
> d'accord! :-)

Pas d'accord !

Could you exactly say what's the difference between a piece of software running on an Atari machine ....
Oooops I could have said an "Atari clone" or a piece of software running via an Atari emulator ?

For me, a simple user, I can't say and I can't see any difference ; in both cases the same appears on the screen
even if these are different screens running from different genuine OS ...

What I can say today is :
- buying a Milan is a good but expansive and lonely way to continue to use the existing software. And for the moment this
appears to be more or less adventurous .... but of course, being an atarist today is purely adventurous.
- making running existing software on an alternative machine make your programs run faster than ever and it opens your mind
to another world which is, after all, one very exiting way to open your mind.

I continue to be an average computer user with, side by side, my good old second handed transformed WoodTTower and
my not so old second hand Apple Macintosh.

Magic Mac is perphaps not THE FUTURE, but what I can say is: it's now MY future.

And I don't bother if there is nobody else thinking the same ...

What I live is my own experience and definitely not the experience of somebody else .... but, of course,
that's quite a normal way to live.

I was a true crazy atarist, I have now become a little more experienced .... must I apologize for this ?
I never will.

1610. Ghostscript and PDF files

Newsgroup: comp.sys.atari.st
Date: 1999-11-01 00:00:00 UTC
From: nameerf@flash.net
Message-ID: <zaoT3.934$w9.125300@news.flash.net>
Source record: 71258

I am required to read certain materials for some of my
classes at the University, which are in PDF files on class web sites.
I've tried to set up Ghostscript on my Falcon, but have had little
success geting it to do what I want. If I download a PDF file, and
try to view it, I get some kind of error and all sorts of junk on the
screen that I don't understand. I've tried Ghostscript 3.53 and GEMGS
1.2, with similar results for both.

What I would like to ultimately do is set it up so that I
click on a PDF file link in CAB and Ghostscript is loaded and the
file automatically displayed, like Adobe Acrobat does with Netscape
on PC. First, is this possible? Second, how do you do it?!?!?! Any
suggestions would be extremely appreciated, since my tests are
quickly approaching and I haven't had the time to get into the
computer labs at the University. Thanks for any help!!!

My aixit board has been working fine for quite some time...
Equal amount of air time... you dislike them I happen to be
one VERY satisfied customer.

Perhaps your tinkering inside your TT led to the failure?

Geneva provides most of the features available elsewhere, sacrificing a little power for very strong compatibility. Practically everything runs under Geneva. It is still my standard system, though I'll probably experiment running it with MiNT underneath soon. Dan Wilga, unfortunately, hasn't done much with supporting it the last couple of years.
> Lastly, will it work with the Thing desktop using multitasking or
> should I spring for Neodesk also?
Thing should work, though I'm not sure.
> I'd mostly like to know a little more about Geneva.
Go to www4.pair.com/gribnif/ for the demo. It's pretty functional.

1621. Still Can't Get I-Connect to work!

Newsgroup: comp.sys.atari.st
Date: 1999-11-01 00:00:00 UTC
From: Lewis <lewisfowlerNOIeSPAM@uswestmail.net.invalid>
Message-ID: <000b8d9b.b8337053@usw-ex0102-011.remarq.com>
Source record: 71269

Okay, still getting a stall when I try connecting with I-Connect.
Stalls during "Negotiating PPP Connection" with a error mentioning
"Timeout during PPP Connection". Double checked my login script,
including password and login name typos. Called my ISP and they are not
using a CHAP protocol. Tryed reinstalling I-Connect/CAB 2.5 following
the intructions carefully (didn't work). Still confused about my Auto
folder. I have sockets.prg in their, but HSMODEM shows up as a folder
in the PPP folder. In the HSMODEM folder their are all kinds of
drivers... their is the driver.prg and scc.prg for the falcon. Anybody
else using these or know how these should show up in the Auto folder.
Someone mentioned that if HSMODEM isn't installed, that I-Connect won't
even start (which is not the case with me.) I don't know of any special
parameters that my ISP needs, so I'm once again stuck. Will upgrading
to 2.7 help?

Jeff,

Geneva provides a co-operative multitasking environment (ala Windows 95/98 and older Mac OS's). Mint and MagiC are preemptive. Thing works fine as a replacement desktop under Geneva. Geneva's real strong point is program compatability. If a program will run under TOS it will run under Geneva (almost 100% :>). MagiC, OTHO, occassionally has problems with programs, esp. older ones. And while you can use Mint under Geneva the total memory usage may be larger than MagiC alone.

A TT with only 4 megs is kind of like a car with a V6 engine and 2/3 of the cyclinders not firing. I would really look around for a 16 meg TT ram card (see if you can find one used) - it makes a BIG difference as far as speed.

Jeorgen,
Thanks for sending me XCONTROL. It seems to work fine. It was'nt
until recently that I realized my copy (which came with my new Falcon
around '95) never had Minimum# of CPX's to load.A side benefit for me is the
form of the date. I've never been able to get it to read
month/day/year! It now does. Life is working again!!! As far as some
CPX's not loading, we'll see on that.
Thanks again,
John

Your Auto Folder should look like mine,

1 XBOOT.PRG
2 NEMESIS.PRG
3 NEM_HI.PRG
4 DRIVIN.PRG
5 JPEGD.PRG
6 MAGXBOOT.PRG
7 NVDI.PRG
8 VIDELITY.PRG
9 SCC.PRG
10 SOCKETS.PRG
11 XMEN_MGR.PRG

And I don't think 2.7 will help but since I never used 2.5 I dont
actually know.

Regards Colin Doc

1630. STRAM and TTRAM for sale !

Newsgroup: comp.sys.atari.st

Hi guys !
So many of you have replied to the memory issue of the TT and I believe now it's possible, but
what will it cost ?? What if we take our daughterboards to Hannover and one of you is there,
fully equipped with soldering irons and chips, to modify these boards to 10 Mb ??
How much time will it take ?? Is there a possibility to buy TTRam boards ??
Now I fear that this discussion ends in a technical story , which for some of us is too difficult and
also not interesting.....
It's the same as CAB 3.0 , there are so many wise guys among you, but no one dares to begin a fast
browser project for Atari. Wensuite, Draconis,it's all shit.Only CAB works fine so this must be the
starting point IMHO.
Come on guys, some of you have the knowledge to biuld beautiful Atari soft and hardware, and
we want to pay a reasonable price for it ! When we want everything cheap, we turn to the shop of Mr.
Bill Gates.....
Jos

Afraid I know nothing about IConnect. HSModem I have and it appears
to be essential if you want any speed out of your serial ports.

You always need DRVIN.PRG plus drivers and these latter depend on
your computer. The following is taken from the English docs:

For ST, STE, MegaST: MFP.PRG
for MegaSTE: MFP.PRG, SCC.PRG
for TT: MFP.PRG, SCC.PRG, MFP_TT.PRG
for Falcon: SCC.PRG

DRIVIN must be followed by the drivers and all must be as late in
the auto folder as possible but before any program which uses them.
All other serial port patches must be removed.

'Late' in this context means the order in which the programs are
stored in the folder and this can be seen by selecting 'unordered'
from the view desktop menu. The order can be changed by using
AUTOSORT or similar program, or by copying the files in the order
required to a temporary folder then deleting the auto folder and
renaming the temporary folder to auto.

Do you know what they are using to create the files? Don't know which
Acrobat versions Ghostscript supports, but 4.0 has been out for a few months
so if they have used that it may be that GS can't read them :-(

You could install it as an external viewer in CAB, probably not using
VA-Start as I doubt if GS understands AV-Protocol. I'd be surprised if it
wasn't possible, but you'll need vast amounts of RAM, particularly if the
Acrobat files are large. Both CAB and GS need a fair bit of RAM: I wouldn't
contemplate this arrangement on a 4Mb ST, for example, if you already had a
multitasking OS and NVDI going.

Haven't got round to it yet, but I'll let you know when I do (possibly
tomorrow = Wednesday).

> > Rather than reinstall/reconfigure everything I just set up a bunch
> > of folders which are mapped to the relevant drive letters and copied
> > the stuff across.
>
> How did you copy all that stuff from your STE to MPC?

Using floppies, zipping whole directory trees on the STE and unzipping them
on the PC. Took a looooong time zipping and copying to floppy, though (I did
it over several days: make sure you have a good book to read while you do
it!). I keep meaning to try a STinG/BNet network connection but I've never
quite got round to it.

> I want to do the
> same thing except I don't have an ST hard drive.

Problem with the above method then unless you have two floppies as STZIP
won't have anywhere to put the archive if you see what I mean.

> All of my important
> stuff is on floppies but many of them can't be properly converted to
> disk images on PC. I beleive it's not because they are damaged but
> probably because they are not in standard 720Kb format.

Which leaves you with four options:

1. Copying the stuff onto 720k floppies formatted DOS-compatible, very
long-winded with only a floppy drive.
2. Using GEMexchange (an Atari floppy reader for Windows from the GEMulator
web site), but the free version will only let you copy one file at a time
off the disk.
3. Using the ST-PC utility to try to convert the disks to DOS-compatible,
dangerous as it might leave the disks totally destroyed so I'd only use it
as a last resort.
4. Transferring the data using a comms program on each machine and something
like ZMODEM. You'll need a null modem cable to connect the serial ports for

this one, but it may be the best option if you have a lot of stuff to copy over. Use something like Connect on the ST and HyperTerminal on the PC (as you'll have it anyway). NB I haven't tried this, but have read in several places that it works well, if slowly.

Hi (Java-ites?),

I was wondering if any of you have taken a look at Dan Ackerman's Java program. Right now, it's a TTP program, but he is hoping to eventually make it capable of "VA" starting - so I suppose it could be used in conjunction with CAB??? Anyway, go check out his page:

http://www.netset.com/~baldrick/

I hope something can be made of that program, as I'm getting tired of running into those JAVA pages.

Thanks,

Clayton Murray

Why not use any one of the already setup networks? Like IRCNet for
example. Already quite a few Atari users there, some 8-bit owners as well
as ST.

Perhaps your english is not so good? Calling the developers and hobby
coders "wise guys" probably isn't the best way to motivate them. ;-)

You might consider waiting until such a board is made before asking
so many questions. It's not something that is put together in a hurry.

I happen to have purchased one of the 8meg st ram boards when they were
still available from dealers. I've also managed to aquire 2 more 8meg
boards with my other TT buy-outs. And no, not one of these boards are
forsale. Especially after following this thread and seeing that people
are willing to build them from scratch.

Best Electronics has some boards listed in their catalog, but the prices
are down right scary.

On 2 Nov 1999, Jos Vlietstra wrote:>

Hi (Java-ites?),

I was wondering if any of you have taken a look at Rojewski's Java program. Right now, it's a TTP program, but he is hoping to eventually make it capable of "VA" starting - so I suppose it could be used in conjunction with CAB??? Anyway, go check out his page:

http://www.primenet/com/~rojewski

I had previously posted it was on Dan Ackerman's page. (I deleted that posting). I just went there, and it was nowhere to be found, so I got to thinking it may have been on Rojewski's page. I tried going there, but for some reason, that server seems to be down at the moment. Sorry if I've misled anyone. I hope I'm right this time! :-)

I hope something can be made of that program, as I'm getting tired of running into those darn JAVA pages!

Once again - you must copy HSModem into your auto folder. The running order is important. For a Falcon you need

C:\AUTO\DRVIN.PRG
C:\AUTO\SCC.PRG
C:\AUTO\SOCKETS.PRG

In that order.

I wouldn't mind betting that IConnect will burst into life, assuming that your script is correct.

Presumably all kinds of error messages? Make sure that you can read the sample PostScript files supplied before attempting anything more. That will at least prove that your installation is correct.

Unfortunately GS' PDF reading abilities are lagging behind development of the PDF format, so it's possible that you won't be able to read these files anyway.

How did you copy all that stuff from your STE to MPC? I want to do the same thing except I don't have an ST hard drive. All of my important stuff is on floppies but many of them can't be properly converted to disk images on PC. I beleive it's not because they are damaged but probably because they are not in standard 720Kb format.

1646. Geneva alone?

Newsgroup: comp.sys.atari.st
Date: 1999-11-02 00:00:00 UTC
From: jba4@po.cwru.edu
Message-ID: <381e5079.67625735@news.cwru.edu>
Source record: 71277

Hey everyone! I'm still setting up my new TT030 and I was considering a multitasking environment. I do have a problem though; I have only 4 meg of ST RAM and that's it. On top of that, I do not believe that this is the upgradeable card (ie make it an 8meg card instead of 2 meg) that's been discussed lately. So I'm kinda short on RAM.

From what I've read, if I want a graphical front end with MiNT, I need more RAM period. I also really can't afford MagiC at this time (I also don't know what it requires for a system,l but...)

Now I have read that Geneva is a multitasking AES, but I'm a little confused. Is this AES replacement still supported by the author actively? Also, will this be a sufficient multitasking environment? Lastly, will it work with the Thing desktop using multitasking or should I spring for Neodesk also? I'd mostly like to know a little more about Geneva. Doesn't seem to be the most popular of the multitasking systems. Just wondering how it does on its own (without MiNT).

Any help is greatly appreciated! Thanks in advance!

>years.

I've been experimenting with Geneva under Mint recently, and although
I had some problems figuring out that I needed to run most stuff
before Mint (duh?), it seems to run very nicely! The only problems
I've run into are:

1. Neodesk slows the system down quite a bit. Using Thing
instead brings it back up to speed, and in fact, with
Geneva/Mint/Thing combo, everything feels a little
faster, especially CAB/Internet stuff. Also, using this
combination plus Boxkite as a replacement fileselector
allows complete access to long filenames if you need it.

2. Running GEM Bench, the Display tests work fine, but
running the CPU tests (specifically the Floating Point and
ROM Access tests), my computer freezes up. This hasn't
seemed to affect any other programs that I've noticed.

So Geneva actually works fine with Mint. If you'd like more info,
email me!

I use Geneva primarily, and it's got its drawbacks, but overall it's a great OS! Yes, it is still supported by the author (Dan Wilga), although he doesn't seem to have been quite as active as he used to be lately. As far as the Thing desktop goes, I personally haven't been able to get it running without using Mint also. But I've heard others have, so it may be a system or software issue. Neodesk works well also. Both have their good and bad sides, but Thing seems to have more overall features. That said, I still enjoy using Neodesk more, but that's just my opinion. Geneva works very well on its own (probably not quite as fast as NAES or Magic, but it isn't slow like MultiTOS AES 4.0/4.1). It is *very* stable and from what I've heard is the best for overall compatibility, as you can have separate settings for each piece of software, and even turn multitasking off if some piece of software doesn't like it. I personally think that with a little more development (ie AES 4.1 support and a few other very minor issues) it could be a great alternative to the other OS's out there, holding its own quite nicely! If you'd like, there's a demo of Geneva that is very nicely representative of how it works. If you'd like the URL for it, let me know!

Gembench test:

Reference: MSTe, TOS, ST High, Blitter ON

Blitting test

With MSTe, Magic 6, NVDI 5, Blitter ON : 116%

With MSTe, Magic 6, NVDI 5, Blitter OFF : 44%

Conclusions

(1) NVDI uses the blitter

(2) The blitter alone is twice as fast as NVDI

(3) The blitter + NVDI is nearly thrre times as fast as NVDI

|Perhaps one of these unanswerable questions but I was correspoonding
|with someone and said to him that a thermometer probe on the
|external casing of the cooling fan of the Hades was reading 38
|degrees centigrade (it is now 39.5). During the summer it would get
|to over 40. He thought it was a little high.

Thanks for the various responses to this. By removing the computer from its 'slot' in the bookcase the temperature fell as expected but only by a little to about 33 degrees.

On a new power supply there is a graph showing the speed of the thermostatic fan vs temperature. It idles at 55% of speed up to 45 degrees then increases its speed with increasing temperature up to 100% at about 55 - 60 degrees.

It looks as though 40 is not bad and certainly although the computer has problems, there is no suggestion that they are temperature related.

Chris> though that the PAL's or whatever are jsut buffering and not a state
Chris> machine MMU...

In Atari terms, MMU means memory controller, not a paging-type MMU
like the MC68851, so let's call it DRAM controller instead (blame
atari for this naming confusion, not me). And yes, it *does* involve
state machines to generate the multiplexed addresses and RAS/CAS
timing.

Chris> No way I can believe this...if there's a way of extending the onboard RAM
Chris> to 8 MB just by a cghip change then the ST-RAM board PAL's are definitely
Chris> just buffers... there's a lot of reasons for doing it like this that I

No, they are not. You can put chips 4* the original size onboard. Or
you can add *another* bank of memory on an add-in card, and the
onboard DRAM controller can't handle that - it does not have the
required additional outputs etc., so you end up building another DRAM
controller. And the slot does not have the signals that go to the
onboard RAMs.

Chris> positive-on-ground on it's front end cos it's easier siliscon to
Chris> make...shgip the signal as positive high and invert/buffer up close to the

I don't think so. Positive and negative logic are both easily
implemented both in PAL/CPLD and in custom logic.

You will never get GEMGS to be anything like as fast as Acrobat. GS is
an interpreter all the way and has to load in additional .ps files as
and when needed. It does however work, for PDF and PS files on my Falcon
and in full colour. I'll send the full package to you private, but
forget about using it as a PDF or PS reader in CAB. It will work there,
I've done it, but the phone bills are enormous!!!

Bob King.

Hi,

I've just returned to the UK from the USA after a couple of years and have just unpacked my Falcon. I missed the thing and am happy to be getting use from it again. But...

I want to upgrade the its RAM, it's only a 4MB beastie just now.

How can I upgrade the RAM?

Is 14MB the upper limit?
Can I still buy the SIMMS to do this? Or do I need a new card to allow newer SIMMS?

I seem to recall there used to be an expansion which allowed an extra 20MB or so to be added, any ideas?

All help appreciated.

Cheers,

Steve

Most likely you were right.

I tried 2 pc utilities, that are able to send a SCSI diagnostic command, with my SyQuest SQ5200 drive (it's the 200Mb version of the SQ555).
The SCSI Diagnostic command can translate between Physical sector (CHS) and Logical Block Address and v.v.
Unfortunately this feature of the command is not implemented on this drive. So no joy from that side.
But , by looking at the primary defect list the indication is that the first half of capacity
is on side 0 and second half on side 1.
On a fixed diskdrive the primary defect list shows a list of CHS values that is marked by increasing cylinder values and where head and sector is (sort of) random.
On the SyQuest the cylinder list is first increasing with head 0 and then restarts from 0 with head 1. So there.

Also: The performance graph for a SyQuest drive is Vshaped (lowest performance at the middle of total capacity. So now I know why
that is: Logical block addresses are counted from side 0 from rim to spindle and back through side 1 from spindle to rim.

Defect Data Utility.

Vendor ID - SyQuest
Product ID - SQ5200C

PLIST Defect Data.
PLIST size is 10.
1. - Head 0 Cyl 119 Sect 40
2. - Head 0 Cyl 707 Sect 36
3. - Head 0 Cyl 1072 Sect 15

That is not how diskdrives work.

>working with half of both original capacity...

No, that won't work because you can't format the cartridge single-sided.
The tracks are written and read in turn on both sides - first track 1
side 0 then track 1 side 1 then track 2 side 0.... With one damaged
head, you won't be able to write or read every other track! At least
that's what I have been told.

Regards, /Peter/

What does this message mean in CAB 2.7?

What can I do, if anything?

Soon after no webpages work, they become blank, including previous pages.

Thanks for your help.

1664. 720k drive on PC - Problems!

Newsgroup: comp.sys.atari.st
Date: 1999-11-03 00:00:00 UTC
From: Hellraiser <justin@hellraiser.nospam.demon.co.uk>
Message-ID: <941655400.411.0.nnrp-02.c2de4101@news.demon.co.uk>
Source record: 71095

Hi!

I recently inherited a 520STE, which I've upgraded to 4mb. I also borrowed a load of old ST disks off my brother, with the intention of using them on my ST and enjoying a bit of nostalgia.

So, I thought, these disks are a bit old, so what I'll do is to use Makedisk and create images of them, burn the lot onto CD, then if a disk should die, I can resurrect it. Great idea! Well, almost all of the disks work perfectly on the ST, but the PC has great trouble reading them, therefore Makedisk can't do it's thing. So, I decided to connect the 720K ST drive to the PC instead, and read from that. The only problem, is that the PC won't recognise the drive, despite changing it to 720k in the BIOS and running in DOS mode (i.e. without '98 loaded). Even stranger, is that a 720k drive pulled from an Amstrad PPC won't work on the ST either!

Oh yeah, the error message off the pc is "Seek error reading drive A:".

Any ideas, anyone? Failing that, anyone got a piece of software that reads a disk directly to an image, and dumps it down the ST's serial port? Thanks!

Yep, use Adamas but first it must work then. The latest version crashes
even more then the previous one. Javascript is just a big joke, at least
on my system. Whatever page I try which holds javascript I get a box
saying 'Illegal characters' and that's it.

Pascal,

it's more like the "Mr. Knows-it-better" type.... Also used in
situations like: the guy sits at a bar somewhere, next come in two
criminals and tell him to move someplace else. The guy, not knowing or
realizing who are facing him, tells them to f.. off, since "I paid for
my drink so I'm gonna finish it first", next one of the criminals
tells him "OK wiseguy, how about a little help?" while showing him
some Magnum-44 or something alike....

In order for the PC to "see" the disk drive, it needs to be set (via jumper) to ID1. The Ataris use ID0. You may have to look up the floppy drive's info on the internet for jumper settings if it's not obvious. I don't know about the Amstrad drive... but your original PC 1.44 drive should work in two formats, 1.44mb & 720kb. Don't worry about the BIOS. If you use Makedisk in DOS (using the F8 while starting Windows, then "command prompt only" method) it should work. It did for me. However, it **will not** work if you try it in Windows - even in a "DOS box". I've gone through this mess before, just like you described!

Hope this helps,
Andy Blakely

1670. Re: Blitter (was: GEM Family tree)

Newsgroup: comp.sys.atari.st
Date: 1999-11-03 00:00:00 UTC
From: Matt Jaap <mjaap@atari-computer.de>
Message-ID: <7vqfitkdc1@nnrp1.deja.com>
Source record: 71101

Hi David,

Testing only the blitting seems a bit unfair since NVDI enhances other
graphic operations as well.

Yes, NVDI uses the blitter and makes it possible to switch this chip
off on a Falcon (important for virtual memory).

This benchmark is taken from the ST-Computer magazine 6/93. NVDI isn't
slower now and the blitting chip is still the same so the benchmark
should still be representive:

Falcon030/16 MHz, TOS, GEM_Test

Monochrom, 640*400
(without NVDI/with NVDI, Blitter off/with NVDI, Blitter on)
Text: 300%/2569%/3201%
Lines: 326%/655%/807%
Rectangles: 822%/950%/1328%
Polygons: 210%/622%/636%
Circles: 255%/1042%/1042%
Rasters: 1174%/819%/1304%
Attributes: 129%/1308%/1305%
VDI escapes: 183%/636%/636%
BIOS output: 164%/368%/368%
GEMDOS output: 171%/232%/232%
AES object output: 198%/615%/647%

So in some cases the blitter really accelerates the graphics output.
NVDI is generally faster than the blitter alone and the Falcon blitter
is clocked with 16 MHz!
The benchmarks are even worse for the Blitter in 640*480/16 colours.

There are severall other software accelerators (TurboST, Quick-ST)
which increase the speed. They all beat the Blitter because they
increase almost every graphic operation.

Greetings,
Matt.

I wouldn't worry about it Galen! :-)
I only found out about that "Connect to host" looking for something else!
now maybe someone can help me out with a NEWSie problem.
I used to be able top select an e-mail, right click my mouse button which
would give me a list of options having to do with that e-mail (like
transfer, or delete, or forward, etc) and then i would select my option
like transfer and a pop-up would come up with all my mailboxes and I
just select the mailbox and presto! the e-mail was stored in that
mailbox! NOW though, instead of a pop-up I get the file selector, and
I have to wait forever for it to read all the files in my mail folder
before I can select the correct mailbox i want to transfer the mail to.
Has anyone else experienced this? Do you know how to get back the
pop-up? I don't have it in TOS, Geneva or Magic, and I used to have
it in Geneva and Magic, but never in TOS i think.
Could it be related to the size of my mailboxes? I see a lot of
"Sizing file" when I open them up.
thanks/merci for any help

For me it was 'fear of the unknown' (and possible adverse reactions;
computer paranoia). I'm pretty loose about it all now! Anyway, the
date (in setup) is now in the right format now but there must be
something else up with CPX's showing as 'activated' but not accessable
(such as SAM_SET).

ST formatted disks are not readable on the PC, but PC formatted disks
are readable on both.

I remember hearing about some driver that can be installed on the PC to
read ST disks, but I don't know how well it works extended formatted
disks (e.g. 800K disks). Sorry, I can't remember the name of it though.

Message-ID: <3821028B.4CAB7A54@chorus.net>
Source record: 71111

For What it's worth,

I have 3 Atari computers (TT, Mega4 & 2.5 meg ST)
Tons of Atari Software including CALAMUS SL 99.

I also own a MAC G3, with Magicmac6. I have Adobe Illustrator, Adobe InDesign, Corel Draw 8, Corel Photo Paint. Including Virtual PC, a windows 95 software emulator.

Why all this?

I had to be file compatable with all the MAC users in the graphics industry, and file compatible with all the PC users in the sign industry. AS far as the Atari platform. I still do the majority of all my layout & design work in Calamus SL.

I need MAC programs so that I can modify files I get from customers and re save them in the same format that they need. So far; however, with the MAC software that I own, NONE OF IT HAS THE CAPABILITIES that Calamus SL has. Sure, Corel is loaded with capabilities that I never had with my Atari, and the Adobe product line is considered the industry standard. But let me share a little secret with you ...Every person that I showed Calamus SL to, that uses Quark, Pacemaker, commented to me that Calamus has capabilities that these other programs don't have. And the way Adobe has positioned itself with POSTSCRIPT, those capabilities will never exists. The new PDF format from Adobe is a step in that direction, but that will take years to finally catch on and be accepted as the new standard.

Calamus SL, the MacPrint driver, and MagicCmac running on a G3, is faster then any other System today.

I can't speak for others, but in my opinion; the longevity of most Atari users, is based on the CALAMUS users. And as long as there are enough Calamus users to support continued development, Atari TOS will live on in some form!
And as long as that happens, there will be a need for all the other support software, to keep Atari users up to the times. MagiCmac is just part of the picture.

I'll bet that there is still a large number of Atari MIDI users also, that aren't into this stuff as much.

We all own a NITCH computer system. It will never make it to the big times, but can still today prove itself against all the high tech hype, that the big boys through at you.

Now I can see how someone that doesn't get into using Calamus seriously, or professionally, could be overwhelmed and go gouge eyed over the software on a MAC or PC, stating that once you cross over, you will never look back. And I thought that would happen to me!

It hasn't, and I still need my Atari Computers along with my G3 running magiCmac.

I realize that I'm probably a minority, but I've been using Atari Computers professionally, for 14 years. I'm a graphic designer, and I'm a little disappointed in what I've found, when I purchased my MAC! For what I paid, and the cost of the software, I actually found myself limited in what I can do, and how I can do it.

I'm lucky enough to have two EZ135 drives, so transferring files is easy - but in this instance I would probably have used PARCP (from Peter Stelik - sp?) as a faster solution than using the serial port. Download from http://www.cyberstrider.org

The FX board takes up to 16MB FX RAM, but due to the 14MB Falcon RAM limit, you only have 14MB FastRAM minus the exisiting ST RAM, so if you have a 4MB ST RAM board, you get 10MB FastRAM. A beta EMS driver allows access to the additional FastRAM, but due to critical timing in the Falcon, it is not considered reliable.

A full discussion of the FX board appears in my article in the current issue of Atari Computing (AC14). My FX Falcon is pictured in that issue (assuming Joe printed the pic). If anyone wants to add an FX to their Falcon, I am willing to trade my FX Falcon for a stock Falcon, or sell it outright.

They will be able to access the LAN port if you install HS-modem. As
well as allowing access to LAN/MIDI/etc... ports HS-modem allows you
to use those ports at up to 230400 baud.

Using Connect, HS-modem, a Mac printer cable I can send a 1 meg file
from my Falcon to a Mac via null modem in about 1.5 minutes...

Now THERE'S a challenge! I'd bet that someone out there could possibly write a huge convoluted piece of code and get mario to build a DMA->IDE interface, and after two years of experimentation, bingo! one page out of a WordPerfect 5.1 document out from the SLM804.

But old 300dpi lasers are almost being given away over in the windoze/DOS world. Pick up several, until you find one that works. Meanwhile, save the SLM804 for somebody's still-working Mega ST out there.

Hello mjaap,

m> Ok, there is the applet object in JavaScript but that's the only chain
m> between Java and JavaScript.
I'm sorry, but you are totally wrong.

You can easily exchange data between Java and JavaScript (i.e. a Java
program
is running, passing values to JavaScript which can form the HTML page
after
this). At least, you have full control about Java methods by accessing
them
through appropriate JavaScript methods (OOP is sooo nice ;-)).

Look at the developer's edge at Netscape to see explanations and examples
...

Hello "kevin,

k> not sure I understand do you mean running Tos on top of MPC or what ?
could
k> you explain a bit more please
Not on top, but instead of MagiC.

MPC emulates a complete ST system (other than i.e. MagiC Mac or TOS2Win),

running MagiC as the OS. But you can also use a TOS to be as compatible as

possible (therefore only read/write access on Atari filesystems (in drive

containers) and only read access on Windows filesystem).

Look into your MagiC documentation to see how you have to install a
ROM-TOS.

Greetings, Oliver

You probably mean the JavaScript interpreter. And no it can't be used in conjunction with CAB. JavaScript is designed to co-operate with HTML so the browser needs to support JavaScript. VA can only tell another program to load a file and process it - but JS needs a tight integration within the browser.

>
> http://www.netset.com/~baldrick/
>
> I hope something can be made of that program, as I'm getting tired of
> running into those JAVA pages.

There's a simple solution: use Adamas! You can't turn CAB into a modern browser with just a couple of Overlays and TTPs.

By the way, the address and author is wrong. It was ported by John Rojewski and not Dan Ackerman.

1696. REQ: scans/photos of homecomputer mainboards

Newsgroup: comp.sys.atari.st
Date: 1999-11-03 00:00:00 UTC
From: Stephan Slabihoud <stephannews1@slabihoud.de>
Message-ID: <381FFAC1.DA8F388E@slabihoud.de>
Source record: 71172
Cross-posted to: comp.sys.apple2,comp.sys.atari.st,comp.sys.atari.st.tech,comp.sys.cbm,comp.sys.mac.hardware.misc,comp.sys.misc,comp.sys.msx,comp.sys.next.hardware

Hi,

I am looking for scans of homecomputer mainboards of the 70ths and 80ths. These scans I would like to add to my computing museum (http://www.8bit-museum.de).

Unfortunately a lot of scans are not available yet:

No scan available: :-(
Acorn, Amstrad, Coleco, Dragon, EACA, Enterprise, Excidy, Jupiter, Luxor, Mattel, NeXT, Osborne, Sharp, Spectravideo, Tandy, Tatung, Camputers and Exelvision

A few scans available: :-)
Apple (Apple I), Atari (2600 black, 800XL), Commodore (8032, VC20, C64, C64C, C116, C16, P/4), MITS (8800), Oric (1, Atmos, Telestrat), Sinclair (MK14, ZX80/81, Spectrum Issue 1+2, QL), Texas (99/4A), VTech (Laser 500)

Some of the scans are not very good and I will be pleased to replace them by better ones.

Who wants to help me but does not know how to make a scan or photo of the mainboard can ask for my advice. :-) A picture should not exceed 800 KByte (JPG medium).

Thanx very much

Stephan Slabihoud

Ah, yes. I found something on Netscape's website
(http://devedge.netscape.com/viewsource/smith_js2java/smith_js2java.html
). But they have given the connection between Java and JavaScript a
different name: LiveConnect.

>At least, you have full control about Java methods by accessing

Message-ID: <7vp2jt$j20$1@nnrp1.deja.com>
Source record: 71175

Hi

I would like to change my DD external disk drive to a high density drive, do I need a specific type of high density drive or can I use any type of PC drives? Are there any jumpers that need to be set? The internal drive is high density and works very nicely.

Is it just a matter of changing the drive in the external case and switching on?

Any help would be appreciated.

Many thanks

Paul

C> I realise I've goofed here....That's a truly horrible way to design a memory
C> architecture, and the labelling didn't help either....Anybody got any idea
C> as to the state machine involved....I wonder if Best have any of the chips
C> available?....

Um - what's horrible about that?

Basically, you have a memory controller that can handle the onboard
memory (which is ST-RAM). If you want more, you have to add a card
with a memory controller and RAM.

The state machine involved is a standard DRAM controller like you use
on any othe CPU. There are lots of application notes (I remember some
quite good from AMD, in the MACH CPLD manuals), but if you look at a
DRAM datasheet, it is quite straightforward to design.

BTW: the method of moving the DRAM controller to the expansion card
gives an added flexibility: the original Atari TT-RAM cards used
nibble-mode memory, while newer cards (like the AixTT) manage to
achieve a faster access than the Atari card, using standard FPM or EDO
memory.

St> I want to upgrade the its RAM, it's only a 4MB beastie just now.

St> How can I upgrade the RAM?

St> Is 14MB the upper limit?

Unless you install a new CPU, yes. The 68030 in the falcon is limited
to 24 address lines, giving a total addressable range of 16MB,
including ROM and IO.

St> Can I still buy the SIMMS to do this? Or do I need a new card to allow
St> newer SIMMS?

You can either install a new ST-RAM card (an Atari 14MB card, or one
of the many cards that have a PS/2 SIMM socket, which will take a 16MB
SIMM).

Or you can add a fastram card (like the Magnum/F030 or the card from
BlowUp whose name I forgot), which adds 4 or 8 MB to your existing
ST-RAM, and has the additional benefits that the fastram is (guess
what?) a lot faster than the ST-RAM - more than a factor of two in
modes with 256 or more colours.

Jos> what will it cost ?? What if we take our daughterboards to Hannover and one of you is there,
Jos> fully equipped with soldering irons and chips, to modify these
Jos> boards to 10 Mb ??

10MB of ST-RAM requires an ST-RAM card with an own memory controller -
and it is plug-and-play, no soldering.

Upgrading the onboard ST-RAM to 8MB requires soldering - and you will
have difficulties locating the requires chips in DIL cases.

Jos> How much time will it take ?? Is there a possibility to buy TTRam
Jos> boards ??

As I know that there are still enough MagnumTT in stock, I am quite sure
that you will be able to get them in Hannover.

All has been said about the need of HSModem in others posts.

Maybe your ISP do not allow a script negotiation and attempts to make a
direct PAP negociation and only that. To know this, I suggest you to
initiate a connection with a terminal emulator (StarCall, Coma for
example). Just dial your ISP up and look if it asks you for a login,
etc. I it doesn't and just send you what can seem like weird characters,
here we are, it's a PAP negotiation. In this case, just remove all the
relevant script stuff. I don't recall if the version of IConnect
provided with Cab 2.5 can work like this, but sure v1.7 (may 1999) can.

Bye,
/Pascal/

I replaced the DD drive in an external Golden Image drive. Both the
original and replacement high density drive were Teac drives. It's been
working great for several years. The drive needs to be set as drive 0.

Yes, but unfortunately not all the disks can be transferred this way
(good old Murphy took care this applies to those most important ones).

> 4. Transferring the data using a comms program on each machine and
> something like ZMODEM. You'll need a null modem cable to connect the

Have you tried Ghostlink? It may sound even better than connection via
comm programs:

> Ghostlink is a link between an Atari GEM Computer (Master)
> and a MS-DOS computer (Slave)
> It allows the drives (floppy, harddisk, CD-ROM) installed
> on the slave to be used by the master as a GEM-partition.
> It is possible to connect up to 3 PC slaves (on different ports!)
> ...

If you want a hole description let me know (if you still have a need
for it, that is). I intend to try this alternative as soon as I get a
hold of an operable ST :). But still, to everybody else following this
topic: has anybody tried using this, and does it work ok?

14Mb Board from Wizztronics
" " " WB-Systemtechnik
" " " CENTEK (CENTRam)

> Is 14MB the upper limit?

Yes.

> Can I still buy the SIMMS to do this? Or do I need a new card to allow
> newer SIMMS?

14MB is the limit, you only have 4MB, remove the 4MB and replace the
board with one from list upper. (Board needs 16MB 60nS PS/2 Simm
module)

Other way: CENTurbo2 accelarator. Allows 14MB ST-Ram -and- up to a max.
of 128MB FAST-Ram (TT-Ram)

Use one falcon with 14MB ST and 32MB FAST Ram.
Nice working ,)

> I seem to recall there used to be an expansion which allowed an extra 20MB
> or so to be added, any ideas?

Next: FX-Board.. adds 10MB FAST Ram (Itï¿½s also an accellerator board)
(I think only as second hand unit avaiable)

Ram / Accelerator boards -> DOITF030

Hi all,

Over 100 Atari magazines from the late 80s to 90s. Last count =
ST Format 48 issues
ST Review 21 issues
ST User 15 issues
ST World 11 issues
ST Computing 11 issues
+ a few others, Atari User/Monitor/ST Applications
Still the odd one scurrying out from under the bed so may be more.

25 pounds the lot, P&P would be extra! I'm attending the Stafford show and could bring them along. Feel free to make an insulting offer but I will not split or spend time trawling through them for issue 4,vol2 for collectors, I'm lazy.

Regards, Steve.

Hi,

Check out this site, its a new product that allows Atari ST's to network at 2MB's to a PC through a parallel cable and uses the PC as a bridge to gain access to networks and the Internet, it comes with all the necessary TCP/IP drivers and such, looks like a good product to help ST users transfer files back and forth from their PC and also if someone has a high speed cable modem or DSL at home, now they can use this to hook their ST to the Internet via high speed connection and use CAB 2.7 to get on the net!

Hi Justin,

Atari has a special disk format for it's own disks, but it can read PC formatted or even other formats without problems. There are programs with which you can create your own formats (I must have it somewere).
What you can do is the following:
Format a 720K disk on your PC (to get maximum compatibility).
Do a filecopy from the original disk to the PC-formatted disk on the Atari (Drag and
drop from disk A to disk B, it will cost you some diskjuggling..).
The copied disk is then readable on the PC.

If this doesn't work for you, send me a request for the program (or find it on the internet).

..and dumping to a serial port will cause you a lot of work, so I don't think that's an option.

Regards,
Wim

What's the problem with these? Atleast STiNG and MiNT-Net handles CHAP
and PAP, so does the commercial stacks (IConnect, Draconis, WenSuite).

Source record: 71049

There was a formating program that would write the PC Id on the disk so it
would work on an ST and IBM. YOu needed to do this first otherwise it could
corrupt a file on an ST disk.

I think it was the Magic Formatter? My ST is packed up right now so I cant
open it up, but this utility would format almost any density, Mac format for
Spectre and write the IBM boot file. I recently moved a bunch of ST disks
my from IBM to the ST and needed this program to do it.

If enough people want the real name of the program I'll try to dig it up.

No need to do that - you can pull up a terminal screen in IConnect if you choose this option in IConf.

>Just dial your ISP up and look if it asks you for a login, etc. I it doesn't and
>just send you what can seem like weird characters, here we are, it's a PAP
>negotiation. In this case, just remove all the relevant script stuff.

It can be as easy as:

Send string <phone number>
Wait for CONNECT
Wait for login
Send user
Wait for word
Send password
Done <PPP button ticked>

> I don't recall if the version of IConnect provided with Cab 2.5 can work like this,
>but sure v1.7 (may 1999) can.

Yep, there's no real differences between the two versions AFAIK.

Dials now and again? That sounds more like a problem with your installation than anything else.

>freeze when trying to obtain the IP address :-(. If you have sucessfully logged onto
>Free4all could you please provide details of the login script used etc.

I've posted a script in another message today. Once you're conected I suggest using the get_ip utility from the tools folder and getting the actual addresses of the various servers to plug into your config.

IConnect isn't capable of asking the ISP for a DNS address, you must enter it into the appropriate place yourself, in case this is part of your problem.

There's no particular ISP that's better for Atarians than any other - I use Cable & Wireless myself.

yes, I also had a strange thought reading this.
'A Mac with a realtime operating system?' Impossible.
On second thought: 'they had Mac OS8. Now they are arrived at 9.'

Further:OS 9 is/was available for Atari computers!
I am still running it on a C't 68000 VME-like machine in a industrial
19 inch rack with built-in hardware watchdog and busstate analyser.
Nice realtiming.
With some resoldering I can also run the famous (German?)
RTOS/Pearl OS.

Hi Yann,

Sorry, its been several months since my last attempt at getting a SLIP connection to work. I meant STiK not CAB. I could connect with STiK, but none of the apps (CAB, FTP, Newsie, etc.) could use the established connection. Since others are using it, it had to be something wrong in my STiK configuration, but I could never figure it out.

I'll try STiNG and see if I have better luck.

Thanks

Ken

>
> ST formatted disks are not readable on the PC, but PC formatted disks
> are readable on both.

No, no!!! I KNOW the filesystem is incompatible, but the actual physical tracks and sectors are readable under DOS. All Makedisk does is to read the physical tracks and sectors, and dump them into an image file with the .ST extension, which can then be used either for an emulator, or dumped back to floppy. I know Makedisk works, as I've created a number of .ST files (even 820k disks work), but some of the old 720k disks won't physically read on the PC, whereas they are error-free on the ST. That's the point I was trying to make, the old 720k drive seems to be better at reading old disks. So, all I want to do is to attach said drive to my PC, but it just won't work - I even altered the drive ID as was mentioned elsewhere in this thread, but it still made no difference.

Help!

No no no... The "costly and hard to find" statement by Michael
Schwingen refered to upgrading the TT __motherboard's__ ST-RAM.

> 3) Buy a 8 meg card from a vendor.

That is the most expensive option.

> But why stop at a ST ram board at 10 meg? Is more possible?

Actually, the total amount of ST-RAM, since TOS 2.06, cannot ever
exceed 14 MB on any TOS machine. Any memory above is ignored,
because the address space is used for hardware controlling.

The TT's ST-RAM card can only take 2 MB or 8 MB, because that's
the maximum the RAM controller on the daughterboard can handle.

Cross-posted to: comp.sys.atari.st,comp.sys.atari.st.tech,rec.games.video.atari

Hi all,

From now until the end of December we are running a series of competitions on our website, the Little Green Desktop (http://www.atarist.com). Prizes up for grabs include new Atari ST CD-Roms, T-shirts, Games and a lovely boxed 4meg STE. All competitions are multiple choice and consist of three questions, the answers of which can be found on our site with a little research!

While there you could also sign-up for a free web-based email account at atarist.com, it takes a few minutes to apply for and you get a 4meg mailbox instantly and your own address.

Enjoy the SiTe!

Cheers,

Rich

The normal Atari MMU can only handle up to 4 MB because it uses a narrow
bus that can't address any higher values. Certainly the Magnum board and
I think other extensions have a second MMU on board to handle the
higher addresses - up to 14 MB with STs and Falcons. Don't know about
the TT though...

Should be on any Atari site. The left-hand icon should show you a list
of active and inactive CPXs and allow you to change their status by
clicking on them and then on the Activate/Deactivate CPX(s) button. You
then have to click on the right hand icon to load the new ones.

> 2- Some of my CPX's don't load!

They could be faulty, or you are out of 'slots' or memory. I have 15
CPXs active at present on my 4MB STFM and could probably have more.

>in the first place.

You've got it the wrong way round (for the Northern hemisphere)!
Remember it's 'Spring forward', 'Fall back'. And your 'today' was the
start of fall (or autumn as we call it on this side of the big pond)
while Daylight Saving Time is used in summer! Of course it's different
in the Antipodes :-)

>Anyway, before I used MagiC and COPS, I used to use plain old TOS and
>XCONTROL.ACC. Now XCONTROL has a section right at the top of the ACC itself
>where you manually enter time and date information. It just sort of occurred
>to me today that when using COPS, I don't have a way to change the clock or
>date (that _I_ can see).

But I don't think that entering it in XCONTROL resets the internal clock
- just the current date, which won't hold when you switch off.

There are special clock-setting programs available for setting
hardware clocks. One is Compo's CLOCK.PRG (came with the FMCII
Forget-me-Clock cartridge) but this is not Y2K usable. There is also
AUTOCLOCK.PRG by Cadenza (PD, I think) though I am not 100% sure
whether this only does the same as the Control Panel or whether it
actually sets the internal battery-backed clock as well.

This is a thread about the _TT_ and it is _not_ limited to 4 MB.

Mentioning the ST's MMU in this thread can only confuse the mere
user hoping to learn more about the TT.

Avoid inserting unrelated material in a thread, in the future.
Thanks.

>that is: Logical block addresses are counted from side 0 from rim to
>spindle and back through side 1 from spindle to rim.

I see, thanks. Seems I was wrong then originally. But are you sure that
this isn't just the order that your test program reads them? It seems that
writing only one side at a time s inefficient as it wastes time waiting for
the head to seek and then settle for each track, instead of pairs of tracks.

Both are rising cylinder counts, so probably scans from sdtart first on
side 0 then side 1 - not inwards out as you say above.

There seem to be an awful lot of defective sectors here. Either you have had a head crash (so many sector 81s, 43s and 145s but not *all* consecutive!) or it's just possible that these 'defects' are spurious and result of poor SCSI cabling or termination perhaps.

> 216. - Head 5 Cyl 4358 Sect 60

Again an enormous list. I may have been lucky so far, but AFAIK I have had 0 defect on my WD hard drive and various SyQuest 44 and EZ135 carts.

I really wonder whether yours are genuine faults. Any chance of checking at least the removables on another computer to check? Of course, if the software has marked sectors as bad then this won't work...

Regards, /Peter/

>Hi David,
>
>Testing only the blitting seems a bit unfair since NVDI enhances other
>graphic operations as well.

Matt,

I wasn't trying to denigrate NVDI. The blitter's function is to provide a way of moving within the memory space, quickly, data which doesn't have to start and stop on character boundaries. This is something that the 68000 is not good at. The 68030 is a bit better since is has bit-field oriented instructions.

In the absence of the blitter, a blitting sub-routine has to be used.

The VDI contains hundreds of functions, many of which make no use of the blitter at all. NVDI services all of these. However I thought that the discussion was concerned with the specific question of whether NVDI's software blitting subroutine makes the blitter redundant. The blitting test seemed the most appropriate one for this qusetion.

It's the normal behaviour of this CPX. There are flags to specify if
a CPX must be ran at boot up, if it is visible or not, etc.

Bye,
/Pascal/

Afaik, STinG and IConnect doesn't support CHAP yet. I connot get
connected with toses stacks to two ISPs here (in Vendee, France) using
this protocol.

[snip: script]

Of course. BUT some ISPs do not allow a script connection: just PAP
works (and maybe CHAP, can't say).

1758. FS: Atari Power Supplies (USA)

Newsgroup: comp.sys.atari.st
Date: 1999-11-04 00:00:00 UTC
From: "Sheldon H. Winick" <s.winick@worldnet.att.net>
Message-ID: <7vtbjtkdi1@bgtnsc03.worldnet.att.net>
Source record: 71084

Gotta clear out my remaining stock of Atari Power Supplies. The following
are all NEW, most in original Atari box or plastic bag (as shipped to me by
either Atari or Best Electronics). Clearance prices INCLUDE Priority Mail
shipping within the continental USA only.

Part # For Atari System: Price Each:

CO17945 400/800/1050 $10 (6 available)
CX261 2600/XEP80/SX212 $ 6 (3 available)
CB10350 7800 $10 (2 available)
CO70099 520ST $12 (1 available)
CA026211-001 SH204 (internal) $10 (1 available)
CB102160 Falcon (internal) $25 (1 available)

I also have the following USED Power Supplies available. Prices INCLUDE
Priority Mail shipping, same as above:

C107945 400/800/1050 $ 8 (3 available)
CO61636 Printer $ 5 (1 available)
CO70099 520ST $ 8 (3 available)
CO70091-014 SF314/SF354 $10 (2 available)
CO14319 (unknown) $ 5 (1 available)
C103599-401 (unknown) $ 5 (1 available)
CO16353-101 2600/XEP80/SX212 $ 5 (1 available)

If interested, please reply by Email to s.winick@worldnet.att.net

(Update: 11/04/99) I've just added a bunch of Titles to my Atari 8 Bit SoftWare Catalogs. All Games!!! A number of them are UnOpened! Many for only $5 a pop! And I went through my Catalog and did some adjusting of prices. Right now my 8 Bit SoftWare Catalog has a bigger Byte count than ever.

Atarians Unite! Are you pining for the days of a simpler Computer? Do you miss Arcade Classics like Asteroids, BattleZone, Joust, Missile Command, Robotron 2084 and my favourite Star Raiders! Well Bravo Sierra Computers has them. Are you wandering, wandering in the desert of violent video games. Games too violent for children? With Blood & gore? Two companions of youth nowadays. Especially those you hear about in the news who kill fellow students at school. If your preferences for games lean more towards family friendly. Like it used to be. Try some of my Atari Arcade classics. I have oodles of Atari SoftWare! As well as truckloads of Atari HardWare. And Libraries of Atari Books. Reference material and things you thought you'd never find! So come check it out. The best of Classic Atari 8 Bit & Atari ST. E-Mail me at

e-mail: atari@benjamin.net

Or call me anytime at (503)256-9974 to talk to a warm, friendly, people person! Your more likely to reach me from 3 PM-3 AM Pacific Standard time. And thats most likely the times I can return calls. I'm perfectly willing to call you, on my own dime to answer your questions. I'm a people person and those who have dealt with me will find me patient, a good listener and even a good teacher. So if you can't call me Today? Call me Tomorrow!

Click for WebSite!

I've added more and will be adding more Hardware, Software, Books and Accessories for Classic 8 Bit and Atari ST. So checkout what's new on my WebSite. In Fact check it regularly as my Catalogs are updated regularly. I have 6 different Catalogs, and my SoftWare Catalogs are my largest. They have the biggest Byte Count. And remember if you can't come see me today, come see me tomorrow!

also, if you live in Portland, Oregon, interested in Atari and want to meet with other Atarians. Read the Ad near the bottom of this message.

FREE Catalogs for Classic Atari 8 Bit & Atari ST Computers! Hard-
Ware, SoftWare, Books & Accessories! View Atari Catalogs on the Web at
http://www.atari.benjamin.net And Jump to my FTP site linked to my Web
Site so you can Download Free Catalogs or FTP directly to my site at:
ftp.teleport.com/vendors/bensmith/ If you can't get Catalogs that way,
Feel free to Request catalogs through E-Mail. Really, it's not an
inconvenience. I do ask that you specify Atari 8 Bit, Atari ST or Both!
Then I'll send them to you by E-Mail Only. Not Snail (Postal) Mail.
Please let me know if I can attach text files to your E-Mail. Catalogs
are just regular ASCII text files so you can download them into your
text editor and view them, edit them or print them out! It would make
things easier for me if you take my Catalogs, load them into your text
editor, delete what you don't want and E-Mail me the rest! To expedite
things, include your complete Mailing address so I can figure your
Shipping/Postage & Handling. I'll be back after the weekend.

If you have an Atari and live in Portland, Oregon. U.S.A. or vicinity,
you are cordially invited to attend a Meeting of the Portland Atari
Club. You don't have to be a member to attend. We meet the 2nd Tuesday
of each Month. Our Next meeting will be Tuesday, November 9th, 7 pm
at the Pizza Baron at 2604 S.E 122nd Avenue in Portland, Oregon. Get
together with other Atarians. Make friends, meet new people, maybe find
an old friend. Eat Pizza, drink Pop & Beer in a decorative atmosphere.
Bring your family to a family friendly place. For more info try:

http://pac.pdxweb.net

e-mail: atari@benjamin.net

An after thought.... it doesn't matter which disk drive you use.
Compatibility lies within the operating systems of your machines.
My suggestion is to *only* use DOS for disk operations. Atari
computers are compatible with MS-DOS formats...Even says so
on the original advertisements! I heard earlier TOS versions than
1.4/1.04 had some kind of problem with compatibility, but any STe would
be compatible for sure. Another thought... you might encounter
problems if your Atari disks are formatted in something other than
720k.
Anyone want to add to this?

I'm pretty sure this is a setup/installation problem. The Milan is, I guess, a very stable machine in itself. But ofcourse, if you use applications that go directly to the hardware, expecting to find Atari hardware, you get a lot of strange behaviour... but this is not the Machine's fault.

The Hades is more compatible in that way, I guess, since it has most of the ST-hardware at the "almost" same addresses, while the Milan have different hw-addresses for certain things. With almost the same addresses, I mean that the Hades have the YM-chip mapped to 0xFFFF8800 while the ST being a 24-bit-address-bus machine, have those at 0x00FF8800. But the .w addressing mode, which most accesses to the ST I/O area uses, sign-extends the addresses, and therefore it works on a 32-bit machine too. (on TT, the ST I/O area is shadowed to 0xFFxxxxxx). With the few apps that dont use the .w addressing-mode, this can be a prob. But since one can remap the ST I/O area using the PMMU, this also works on the Hades...

How do you switch the blitter on/off with MagiC, or for that matter Thing?
There is no drop down menu like there is in TOS2.06 allowing you to switch
the blitter on/off.

I've tried switching it on/off in TOS2.06 but it makes no difference when
loading Gembench, it always shows the system as blitter off or at least
the boxes aren't highlighted.

Nothing wrong with that, but with my server you don't get netsplits,
rude teenagers, cybersex requests, spam, nick problems, etc. On the
other hand, since my server is on my personal machine, there are times
when I reboot or in some way disrupt the server. It doesn't happen
all that much but it does a little. A good friend of mine, who also
has a dedicated connection like I have, but also has a totally
dedicated Linux box for running his servers, has offered to host it
there. That machine of his almost is never taken down.

Like I said, it doesn't matter to me. I just think that it's nice we
have a place to meet for chat that's half way reliable. Does nothing
for me to be the one hosting.

Ditto. I kinda miss my COCO 3. It was fun and simple to program,
even in ASM. Worked great as a micro-controller too; perfect as
a home-made CTC Board console for my model trains layout.

I've seen there is a COCO Webring out there, with lots of nice
hardware projects (IDE controllers, RAM upgrades, etc.) also.

I should ask my mom to ship it over here, it might be fun. ;-)

1766. Wanted/Trade: Hard drive for Misc ST items

Newsgroup: comp.sys.atari.st
Date: 1999-11-04 00:00:00 UTC
From: gwestndrf@aol.com
Message-ID: <19991103215105.01337.00000030@ngol07.aol.com>
Source record: 71122

I'm interested in trading items from the following list for a complete hard drive setup for my 1040STf. I need everything; the DMA cable, case, drive, controller, hard drive software. Size is not that important, 20 to 30 Mb is plenty as long as the equipment is in excellent working condition.

I have the following to offer: SM124 monitor, SF314 floppy disk drive, Practical Peripherals printer buffer (1Mb), Practical Solutions monitor master. I also have a number of Atari 8-bit items, if interested. All of these items are in excellent working condition and in good cosmetic condition.

If you have a hard drive setup you are willing to sell, but are not interested in trading, let me know what you have and your asking price.

Please reply to gwestndrf@aol.com.

Thanks,
Gail

1767. Correction: Wanted/Trade (US only): Hard drive for Misc ST items

Sorry. I forgot to mention that I am only interested in deals with folks in the continential US. International shipping costs are prohibitively high for what I'm interested in spending.

I'm interested in trading items from the following list for a complete hard drive setup for my 1040STf. I need everything; the DMA cable, case, drive, controller, hard drive software. Size is not that important, 20 to 30 Mb is plenty as long as the equipment is in excellent working condition.

Hello everybody,
a new Doom version for Atari is available.
All OS dependent routines can be chosen at start now.
This is a preliminary work, and it may (or may not) work on all Atari or
clone with a 320x200x8 bits video mode or higher.

Source record: 71125

Hello,

Just received an email from my ISP saying that all "SHELL/SLIP/STATIC"
access will terminate on Dec 1st. Just PPP from now on.

Although I could never get it to work, I know there is CAB, etc. for SLIP,
but is there anything available to establish PPP connections?

TIA

Ken
